With Safari, you learn the way you learn best. Get unlimited access to videos, live online training, learning paths, books, tutorials, and more. This simple starting point lets you open any one of the nine most recently opened files, create a new web page, view instructional videos, and access online help. It disappears as soon as you open a web page. That is, the edges of all the windows touch each other, and resizing one window affects the others around it. This type of interface is common on Windows computers, but Mac fans accustomed to independent floating panels might find it strange. Give it a chance. Out of the box, Dreamweaver documents appear in Split view—HTML code on the left and a visual preview of the current page on the right. If you prefer to see how your page looks as you add and delete elements, click the Design button in the Document toolbar; that hides the HTML view and brings the preview page full-screen. Even so, the features and functions generally work the same way. If your monitor is wide enough, Split view is a great way to work: To add text to a page, for example, you simply click inside the window and start typing. The status bar at the bottom of the window provides some useful information, like how quickly the page will download to a browser and the way the page encodes text. You can also instruct Dreamweaver to display the current document at different widths and heights so you can simulate what the page will look like when viewed in different size browsers, such as those on a mobile phone, tablet, or desktop computer. When you build a page, you work in the document window, and, as you add pages to your site or edit existing ones, you open new document windows. Several other screen components provide useful information about your document. When you have more than one web document open at a time, small tabs appear at the top of the document window—one for each open file. The name of the file appears in the tab; to switch to it, just click its tab. Tip If you mouse over a document tab and pause, the location of the file appears in a small pop-up window called a tooltip. The Document toolbar lets you change the title of a page, switch between Design and Code views, jump to Live view to see how the page looks and works in a web browser , preview the page in different browsers, make sure your page is free of HTML errors, and change the look of the document window. Note You may find two other toolbars, the Standard toolbar and Style Rendering toolbar, useful. The Standard toolbar is common on many Windows programs and includes buttons for frequent file and editing tasks, like creating a new page, opening a page, saving one or all open documents, canceling and repeating commands, and cutting, copying, and pasting page elements. Most of what you put on a web page winds up in the body of the page, but some elements are specific to a region of the page called the head. The Tag Selector is extremely useful. It provides a sneak peek at the HTML that composes your web page, behind the scenes. In addition, it lets you isolate, with a single mouse click, an HTML tag and all the information inside it. It selects everything in the document window. After you do, you can press the delete key to instantly get rid of everything in your document. Deleting all the code gives you an empty file—and an invalid web page. The Insert Panel Dreamweaver provides many windows for working with the various technologies required to build and maintain a website. It calls most of its windows panels, and they sit in tidy groups on the right edge of your screen. But two are worth mentioning up front: Want to put a picture on your web page? Just click the Images icon in the Insert panel. The Insert panel has many faces; choose the one that works best for you. Unfortunately, this tall list takes up a lot of screen real estate. Finally, you can turn the Insert panel into an Insert bar that appears above the document window instead of grouped with the right-hand panels; this space-saving option is a favorite among many web developers. When you first start Dreamweaver, the Insert panel is open. On the other hand, if screen space is at a premium, you can close the Insert panel and use the Insert menu instead. The menu offers all the objects available from the Insert panel or toolbar, though not grouped by sets, as the panel and toolbar are. Templates let you build basic web-page designs that you can use over and over again, speeding up page development and facilitating easy updates. Want to get some input from

visitors to your website? Use forms to let them make comments, order products, or answer questions. Dreamweaver includes sophisticated form validation so you can make sure visitors input the correct information before they submit a form. Note In Web parlance, a form is a web page that lets visitors type in information that your web server processes. For example, you might ask a guest to type in his email address when he signs up for a newsletter. The Data category provides tools that help you build dynamic pages: If you liked it better the old way, right-click the Insert panel and then choose Color Icons. This action not only brings back the old Insert bar, it also adds color to all the buttons. Spry is a technology from Adobe that lets you easily add interactive features to your site, from drop-down navigation menus to animated effects to complex displays of data. Basically, Spry is a simple way for web designers to insert complex JavaScript programming into websites. The objects listed here simplify the creation of page elements like lists, form fields, and text areas for mobile-enhanced websites. If you build websites that non-web-savvy folk will update, Adobe offers a commercial service called InContext Editing, which lets nontechnical people edit web pages using a simple web-based interface. Business Catalyst is a web-hosting service for web designers whose clients require sophisticated e-commerce capability, mail-list management, advanced web statistics, and automated tools to manage and update their sites. Dreamweaver includes a Business Catalyst panel that lets you manage hosted sites. This category of objects lets you format typeâ€"make it bold or italic, for instance. Perhaps the most useful category, Favorites can be anything you want it to be. After you discover which objects you use the most like the Image command, if you work with a lot of graphics , you can add those objects to this set of personal tools. For instructions on adding objects to the Favorites category, see the box on Adding Favorite Objects to the Insert Panel. It gives you a quick way to open the files you want to work on just double-click the file name in the panel. To use the Files panel effectively, you need to create a local site for each website you work onâ€"setting up a site is a specific Dreamweaver task and one of the most important steps in using Dreamweaver correctly. How can I see my most-used objects in one place? Dreamweaver includes a marvelous productivity tool: It lets you collect your most-used objects in a single place, without any interference from the buttons for HTML tags and objects you never use. This is the timesaving feature for you. All the objects available in all the Insert categories appear in the left-hand list. Repeat with other objects, if you like. To rearrange the order of the toolbar buttons, click one and then click the up or down arrow. Depending on whether you display the panel buttons with or without labels, buttons you put higher in the list appear either toward the top of the panel or toward the beginning of the rows of buttons. You can even use the Add Separator button to insert a thin gray line between buttonsâ€"to separate one group of similar objects graphics-related objects, say from another such as form objects. Each item you add becomes a single button on the Insert bar. To delete a button or separator from the list, select it and then click the trash icon. Click OK to close the window and create your new list of Favorite objects, which are now available under the Favorites category of the Insert panel. After you create your Favorites tab, you can always add more objects or delete ones you no longer need by right-clicking Control-clicking the Insert bar and then, from the shortcut menu, choosing Customize Favorites. Suppose, for example, that your boss has decided she wants her picture to link to her personal blog. After highlighting her picture in the document window, you can use the Property Inspector to add the link. The Property Inspector is a chameleon. For now, though, here are two essential tips to get you started: In the Property Inspector, double-click any blank gray area to hide or show the bottom half of the Inspector, where Dreamweaver displays a set of advanced options. When you want to create paragraphs, headlines, bulleted lists, and bold or italic text, click the HTML button. When you want to change the appearance of text its font, color, and size , use the CSS buttonâ€"or, better yet, use the CSS Styles panel, described on Phase 1: Set Up the Style , to choose from a much wider range of formatting options. The Layout menu lets you switch between the raw HTML view and the visual Design view a rough approximation of what a page will look like in a web browser. You can also see both the code and design at the same time by selecting Split view. Selecting this option lets you view the code for a page in two windows, side-by-side. Extensions are addon features some are free and some cost money that let you do more with Dreamweaver. You can also use the menu to open a Widget Browser to locate and install prepackaged programs that add JavaScript-driven interactivity to a page. The Site menu lets you define a new website or manage the sites you

already have. Both the new site and manage site options listed here are available from the Sites menu. You can choose one of the workspaces Dreamweaver supplies or, as discussed in Workspace Layouts on page 37, you can design your own layout to create the ultimate workspace. The Community Help field is a search function. But unlike the help feature you find in most programs, this search field lets you search the entire Internet for useful information related to Dreamweaver. Type a search term in the field and then hit Enter Return â€"the Adobe Help program launches, loading a web page related to your search and offering a list of links to other, related web pages. You can also tap this option by selecting Help and typing your search terms into the Search field that appears. However, if you have a particularly small monitor, the Application bar will drop down below the menu, taking up a good chunk of vertical space on the screen. Fortunately, you can hide the Application bar if you like. On Macs, the Application bar always sits on its own. With just a few menu items and a search field, the Application bar is mostly a waste of space. You can hide it on Macs as well, but at a cost:

Hi. Really looking for ideas on where to go with this. I am teaching high school pupils and looking at web design. In the first instance, pupils should be getting familiar with the dreamweaver (CS6) UI and creating basic web sites looking at defining site, adding images, text, pages and linking pages together.
