Faulty hard drive Note: Sections 3, 4, 5, and 6 pertain to PC or Mac systems. Sections 1 and 2 pertain only to PC systems. System setup is where the date and time are stored and where startup preferences like NumLock or Passwords are defined. In addition, many hardware settings are defined in System Setup. In particular, hard disk drives are often controlled here. In most cases, the boot drive is Drive 0 or Primary Master. When you add a second drive to the system, it may be need to be enabled by turning it ON in System Setup. Sample screen shot showing a Dell System Setup section for disk drives: To be able to hit the F6 button, you must restart the Setup process, and watch the bottom of the screen after pressing Enter on the "Welcome to Setup" screen. This message will only stay on the screen for a couple of seconds, so press F6 as soon as you see it appear. Click to expand After this is done, you will see other messages appear, and it will act as though nothing is happening, but eventually a screen will appear that will allow you to install the drivers for the add-in SATA controller. The screen will look like the sample below: Click to expand After you press S, the driver install process will continue and the floppy diskettes will be needed. Further instructions will be furnished after the driver install process has ended. Click to expand Insert the floppy diskette containing the drivers for the add-in Serial ATA controller. A few further notes on the driver diskette: These drivers do not come from Seagate; they come from the motherboard manufacturer. Simply load the required drivers on the diskette and have it ready. Here are some images of Serial ATA cables. The BIOS will not detect a hard disk if the data cable is damaged or the connection is incorrect. Serial ATA cables, in particular, can sometimes fall out of their connection. The easiest way to test a cable is to replace it with another cable. If the problem persists, then the cable was not the cause of the problem. UDMA cables have color coded connections which require proper orientation when connecting. Blue connector - always connects to the motherboard. Grey middle connector - is used for slave devices on the cable. Black connector - is used for master device connection. Click to expand to determine whether it is providing sufficient electrical power to operate the drives and devices you have in your computer. If the drive is still not spinning, connect it in another computer if possible. If the drive does not spin up after all of these steps, please visit the Warranty page to begin a warranty replacement order.
