Additional info for Biological Control in Plant Protection: A Colour Handbook, Second Edition Sample text More importantly, this harmful effect is likely to last on the sprayed leaf for up to 12 weeks after the day of application. Unfortunately, pyrethroids do not have such a persistent harmful effect on the pests and may need to be sprayed more than once. This will prevent the successful migration of beneficial insects into the sprayed area and delay their impact as biological control agents for the target pest. The registration requirements for many broad-spectrum insecticides include unsprayed margins, or buffers, as mitigation to protect the adjacent habitats, including hedgerows, from contamination by spray drift. Prompt action in both situations can prevent a lot of damage. However, in some circumstances, pests may be found in an alien environment, such as on houseplants growing in offices or shopping malls; these pests may not normally be present locally but are characteristic of the plants and their environment. It is now possible to initiate and control many pests effectively by introducing mass-produced biological control agents, often in place of or integrated with chemical pesticide sprays.
