My recommendation is – if you see a cabin you like, download the build plans right away whilst they are free. Got a bit of land for your secret bug-out location which needs an affordable cabin? It is a full build tutorial with details, measurements, and materials. The cabin has a door and window at the front and double windows at the rear. The cabin is also wired for electricity with lighting and power points. Well, that is what I thought until I watched the video above which tells the story about this DIY log cabin and how it was built! It really does emphasise the power of community, and roping in friends and family to help out on a project. Seems an awesome trade-off to me. Watch the video and see what you think. Today I am sharing a tutorial to build an earthbag roundhouse, complete with windows and doors. This is very cheap and easy way to build a one room dwelling. The finished house looks beautiful, inside and out. The outside is plastered and whitewashed and it has a thatched roof, have a look and see how nice it looks. Check out the photo tutorial: With build costs this low, it opens the doors to the possibility of many more of us being able to build our own houses. Can you imagine if this was your weekend and holiday retreat? It would be amazing, I feel less stressed just looking at the photo, let alone spending time there! The cabin is absolutely beautiful inside and out check out the sink! I love the hillside, treehouse style rear porch!

Custom Log Home Kits with Free 3D Design This is our mobile responsive website and is not always current with pricing updates and new model styles. This is the best time to build a new log home. Interest rates are still low. Labor is more plentiful and of higher quality than during the housing boom. The best part is that we can custom design your log home package to be the exact log home design, and offer it at below wholesale. We sell log home kits direct to the public, whether you are a log home builder, first time log home owner, want to build your first log home yourself and with friends, or want to hire most of the log home construction out, do what you can, and get the best quality product and design, at the absolute lowest cost. Lazarus Log Homes has the highest quality, most complete, and lowest cost log home packages and kits there are, period. We have a comprehensive construction guide, full plans, and tech support, all free! We not only bid our materials, but cost out the remainder to help you with determining your budget for your log home. We help you estimate water, septic, power, utilities, and estimate every hour of labor from the foundation to the finish, as well as all other materials you will need to purchase to complete the home. Most banks require a turn-key estimate, plans, and a bid for log home kit materials, and we give you these so financing the rest of your log home construction loan or equity based loan is much easier, and less stressful. If you have cash, you want to know what everything else is going to cost as well, all common sense. Our logs are very unique. We use high elevation, completely dry logs that were dried naturally from forest fires and windswept alpine ridges, found only in our area. Our unique climate means tighter growth rings longer winters , denser, harder wood slow growth high elevation timber , and lightweight logs, as they are fully dry. Our log walls are stronger, as each row of logs is glued to the one below, lag bolted, as well as screwed, so when you have hard, dry logs, and use our methods, there is no stronger log wall in the log home industry. We have over designs that are not on our website, that we can start from, so we can get very close very quickly. We can help you with getting a little more eye appeal in your design, and offer you options that keep within your budget. You can build the very best log home for you, and the best part, is that you can do this cheaper than a framed home, and have it be worth twice as much, so you create equity, get the home you want, on the property you want! Click on all the colored buttons on top, and you will learn what you need to learn.

Traditional methods of log-building have been passed down from a time when people went out into the woods and built cabins with little more than an ax, a saw, and an adz. Those techniques required skill and time to carefully scribe and notch the ends to fit together. The logs had to be notched because it was the only way to tie the pieces together as a stable structure. Some methods included scribing and fitting the entire length of every log. Fortunately you do not have to become a master craftsman to be able to build a high-quality log structure in relatively little time. Today there are inexpensive modern materials available that greatly simplify the process of log building so you can put up a house with very little in the way of skill, time, or money. With the "butt-joint" method, you use a big electric drill, lots of cheap reinforcing bar otherwise known as "rebar" , and a sledge hammer to pin the logs together with essentially no scribing, no notching, and no close fitting. The final product is even stronger than a scribed and notched log home. Structurally, there are many advantages to the butt-joint method versus original log-building techniques. For instance, the traditional scribing and notching immediately weakens the logs at the joints and creates vulnerable places for moisture and rot to set in. Also, traditional log houses tend to "settle" over time, potentially wreaking havoc with doors and windows. These log homes have to be carefully engineered with hidden spaces above doors and windows, so that the logs can settle without destroying the openings. On the other hand, the butt-joint method has no vulnerable notches for rot to start in, and all the pieces are so shiscabobbed together with rebar that there is no settling. The window and door frames can be nailed directly to the logs without worry. They practiced on our house, then we helped them build their house, as shown here. Complete instructions on the butt-joint method of log-building are included in my book, *Living Homes: The Hewn-Log House* is a classic of early American architecture, evocative of the pioneer experience and westward exploration. Charles McRaven has been building and restoring hewn-log houses for sixty years, and shares his wealth of knowledge in folksy narration accompanied by photography and illustrations that clearly show every step of the process. In this book you will learn to hew a log with a broadaxe, make a dovetail notch, replace rotten logs, mix chinking mortar and install it properly, find and use vintage logs, use pioneer hand tools, build a stone foundation and fireplace, and install modern utilities. There is no need to pour a ton of money into something as simple as a cabin. John McPherson shows how to do it with logs from your own property, a simple foundation, plus low-cost or recycled lumber, windows, and doors. There are more than photographs and several line drawings to take you through the entire process. Williams The Williams family was inspired by a tornado. The tornado destroyed their home in North Carolina and left them with little more than a wasteland of fallen trees. They had no experience with log construction, but learned to become resourceful with what they had. The book includes coverage of site selection, drawing plans, chain-sawing and squaring logs, tools and equipment, foundation walls, sawing framing timbers, log wall construction, log girders, building floors, roof framing and sheathing, wiring and plumbing tips, chimneys, stairways, and decks, rustic windows and doors, cabinetry and book cases, chinking, insulating, and finishing touches. Chambers Log buildings are embedded deeply into North American history and culture. For more than one thousand years, builders have been weaving logs into homes, shelters, barns, and churches. Today, however, the buildings where we live and work are rarely handmade from natural materials. In this context, handcrafted, scribe-fitted natural log buildings are an attractive and uplifting alternative to conventional buildings and building materials. This book tells you what you need to know to build your own log home and also reveals the deep rhythms and patterns of log construction. Author Robert Chambers shows how to take naturally shaped, tapered, round logs and scribe-fit them one to another so that they look like they actually grew together in the woods. Chambers also offers advice on organizing and financing a log home project and has loads of experience to share on cutting costs and avoiding common pitfalls. He presents practical ideas for saving money and controlling costs. Although handcrafted log homes are expensive to buy, they are within reach for many as owner-managed building projects. This is a

On top of working extraneous hours, truckers have to meet tight deadlines exasperated with pressure by their superiors. A DOT log book contains records jotted down by truckers who detail their activities over the course of 24 hours. According to the log book rules, truckers must keep track of their location and time spent on and off duty. Each trucker must fill out these forms thoroughly and accurately or else they face harsh consequences. Falsifying any information in the DOT log book can make the driver liable of prosecution. The federal regulations required in the Hours of Service HOS forms guarantee that drivers will acquire the rest they need before hitting the road again. The contents of a truck driver log book include the date, name of carrier, truck number, and the total number of miles driven within a hour period. If the driver used more than one vehicle, then it must also be reported in the trucking log book. After filing the basic contents of the drivers log book, truckers can move beyond the skeleton of the form. Drivers should report the starting time of the hour period, the names of all co-drivers, and the shipping document that specifies the carrier and commodity being transported. During the drive, truckers must track their activities by inputting their progress on the graph grid. The graph grid contains a box for each hour of the day. It also has marked areas divided into fifteen minute intervals. The graph grid also provides four lines to help drivers indicate their activities. For instance, a driver may indicate that they are off-duty, sleeping, driving, or on duty and not driving. Truckers should record their duties using a straight line passing through the center of the activity line. It should start from the beginning time to the end of the duty being executed. For instance, drivers transporting property may drive a maximum of 11 hours after taking 10 consecutive hours off. Drivers who transport passengers may drive a maximum of 10 hours after taking 8 consecutive hours off. Drivers should draw a vertical line from the first mark of the previous duty to the next line. Continue to draw the horizontal line for the current duty until it becomes necessary to draw the next vertical line. Be sure to leave comments in the remarks section after completing each duty, especially the time, date, and location. Specify the city, town, village, and state. In fact, record the nearest milepost and highway for pinpoint accuracy. All drivers should fill out their truck driver log book in this fashion. Count the number of hours and re-check to see if it equals Correct all mathematical and grammatical errors to make it as accurate as possible. Be sure to write legibly when recording information in a trucking log book. Drivers should record their activities in their truckers log book to avoid penalties. Drivers who make false reports may face liable prosecution for their actions. A signature confirmation certifies the accurate reporting of activities, making the driver responsible for updating their status as it happens. Many feel that they can handle the road without having silly rules and regulations interfering with their progress. In fact, many feel pressured into arriving early enough to make more money. Others want to avoid getting docked for arriving late. Contrary to popular opinion, the truckers log book protects the driver against runners fatigue. Studies suggest that drivers become less alert to crisis situations when they exceed their driving limits. This may lead to dangers of falling asleep behind the wheel or reacting slowly when it matters the most. Drivers sign their truckers log book, making them liable for breaking the rules. This makes it imperative for the driver to speak up when a carrier demands that they meet their deadline in an unreasonable amount of time. Drivers who encounter carriers who hassle them to break their Hours of Service HOS should tell the carrier that they will not break the rules and regulations.

Few of the books I own, or have reviewed are as comprehensive as this book by the father and son team, Clyde and Jeff Cremer. Their title, "The Complete Guide to Log Homes", says it all this is an all-inclusive guide for anyone thinking about building or buying a log home.

The 1 reason to not buy a kit: Built off site at a construction yard, disassembled and loaded on a trailer, trucked to your property and then rebuilt. This article explains why that is a horrible idea. The construction process is extremely easy for 2 main reasons: You avoid what is normally the hardest part about building a log home. You avoid Keyways, slip joints, screw jacks, etc, which are all expensive to install, difficult to get right and really hard to fix once things go wrong. We can show YOU how he did it. Before exploring how building with real wood is a much better option than a kit, you should first understand why the industry refuses to talk about this fantastic method. Why do they focus on these styles of construction? Hint, they all have one thing in common! Log cabin kits can all be pre-built. Therefore their primary focus is on styles of construction that are weak. Compare that to a real Butt and Pass house. In fact it is so hard to take one apart, it has to be built on site. Going full speed with the blade at full height. A student built his home on Mt Saint Helens. When it erupted the Lahar picked his cabin up and tumbled it miles down river. It was in one piece, and still square when our student found it. In fact, he moved it back to his property and renovated it. A student once built a home at the bottom of a steep hill. No significant damage was done to the building. If there were butt and pass kits, then they would look like this. Advantages of skipping a log cabin kits: Learn all the pros and cons of each style. For instance, here are just a few benefits of building with this method that may impact your decision. Butt and bass cabins: That makes it unique among all styles of log construction, which require exhaustive maintenance and treatments. It gives you so many advantages over a kit. If you are considering buying a kit, then need to become one very well educated consumer. What should you do next? First off, if you are thinking about spending hundreds of thousands of dollars on a log cabin kit, you should think about spending a tiny fraction of that attending our 2-day class in Las Vegas. Our primary focus is on helping people who want to act as owner-builders on their project. This class would still have benefits even if you just want to buy a log home, or a hire someone to build you one. You will learn all the tricks the cabin kit industry that companies use against consumers. You will learn a lot of construction short cuts they take in order to reduce the sticker shock on price, but which ensures you must do tons more maintenance down the road. This class is for anyone who wants to build or buy the best log home, for the least amount of money. So here are the next steps you can take today: Read about our iron-clad, no-questions-asked satisfaction guarantee. But if you have always wanted a cabin, then we can share a better and less expensive alternative with you! Whatever you decide to do, we strongly recommend against buying log cabin kits.
