Share on Facebook Connecting your computers to your home network grants access the Internet, networked printers and attached devices and other computers on the network. Most networks in the home or workplace are Ethernet wired networks or Wi-Fi wireless networks. You also need one wireless adapter per computer, unless your computer has a built-in wireless card. Some modems feature built-in wireless routers, making them a good all-in-one device choice if you have limited space. Image courtesy of Microsoft. Skip this step if your modem has a built-in router. Click the Network icon in the System Tray and check for the wired connection. Start a Web browser and connect to a website. If the site loads, your connection is complete. Video of the Day Pro: Wired connections offer faster and more stable connections than wireless. Wired-only networks are generally more secure than wireless, as unauthorized users have to directly connect to the router in order to gain access to the network. Ethernet cables are less expensive than wireless adapters. Wired-only networks have limited range compared to wireless. While this situation can be mitigated with longer Ethernet cables, you have to run wires throughout your home to access the Internet from any room. The number of computers that can connect to the router is limited to the number of available Ethernet ports. Click the Network icon in the System Tray and find your wireless network in the list. Select your network and click Connect. If you want your computer to automatically connect to this network when you start it up, fill the Connect Automatically check box. You can take your computer to most rooms of your house without having to route Ethernet cables through your home. The design of your home and nearby electronics can interfere with a wireless signal, weakening or even completely blocking your connection. Without a security key, your wireless connection can be detected and used by anyone -- including cyber-criminals engaged in illicit behavior, which may be traced back to you. A Homegroup is a network used by Windows to connect your computers together and share files. After you create a Homegroup, your other computers and devices like printers can be added to it. Select Network and Internet, followed by Homegroup. Click Create, followed by Next. Select the libraries, devices and files you want to share with other computers on the network, then click Next. Press Windows-X and select Control Panel. Click Join now, followed by Next. Select the libraries, devices and files you want to share from this computer, then click Next. Enter the homegroup password and click Next, then Finish. Follow the steps to join a homegroup listed above.
