

Chapter 1 : List of observances in the United States by presidential proclamation - Wikipedia

Days, Weeks, Months and Years. Wow, I just flew in from planet Micron. It was a long flight, but well worth it to get to spend time with you!

How Long Is Pregnancy: Days, Weeks, Months, Trimesters The average human pregnancy is 40 weeks long. However, a pregnancy is considered term between 37 weeks and 41 weeks 6 days. Babies born on or before 36 weeks 6 days are considered preterm or premature. Babies born between 37 weeks and 38 weeks 6 days are considered early term. Babies born between 39 weeks and 40 weeks 6 days are considered full term. Babies born between 41 weeks and 41 weeks 6 days. Babies born on or after 42 weeks are considered post-term or post-date. Prior to October, babies were considered term between week 37 and week 42 of gestation. To calculate the length of your pregnancy, begin with the date of ovulation. The two weeks prior to ovulation are considered weeks 1 and 2 of pregnancy. For women who ovulate on day 14 of the menstrual cycle, day 1 of pregnancy will correspond with day 1 of the last menstrual period LMP. Pregnancy can be broken down into days, weeks, months and trimesters. Day 1 marks the beginning of week 1 of pregnancy, month 1 of pregnancy, and the start of the first trimester. A baby is conceived during week 3 of pregnancy. Day 15 marks the beginning of the week 3. The average pregnancy is 40 weeks long. Another way to talk about the days and weeks of pregnancy is to combine the two units of measurement. Week 1 of pregnancy begins on 0 weeks 1 day and ends on 1 week 0 days of pregnancy. Week 2 of pregnancy encompasses the time between 1 week 1 day and 2 weeks 0 days of pregnancy. A baby born on 38 weeks 3 days of pregnancy is born during week 39 of pregnancy. Although most health care providers will talk about the length of pregnancy in terms of weeks, the weeks of pregnancy can also be combined into months. Because some months are longer than others, some months consist of 4 weeks while others consist of 5 weeks. The average pregnancy is 9 months long. Click on the calendar to view the full size of the image. Pregnancy can also be broken down into trimesters. The first three months of pregnancy comprise the first trimester. Months 4, 5, and 6 comprise the second trimester. The third trimester consists of months 7, 8, and 9 of pregnancy. In addition to the days of pregnancy, the length of a pregnancy can also be determined by calculating the days post ovulation DPO. Day 15 of pregnancy is also 1 DPO. The average pregnancy lasts 40 DPO.

Chapter 2 : Calculate the number of days/weeks/months/years since a given date

Days, Weeks, and Months on a Calendar Resources Tracking time is an important skill for students to develop early on in order to ensure success later in life. Creating a daily schedule starts with understanding the days, weeks, and months of the year, and what each of these factors mean for planning.

On this page you will find Time math worksheets including elapsed time, telling time on analog clocks, calendars and converting time worksheets. The calendars come in two different formats: The calendars are very useful in conjunction with the elapsed time worksheets with days, weeks, months, and years. Students who have difficulty visualizing a calendar may need the actual calendars to use as a reference. Telling time on analog clocks is still an important skill despite the number of digital clocks around; many people still choose the analog clock design for aesthetic purposes. Calendars Specific and general calendars for use in math activities. The calendars in this section are simple everyday calendars that can easily be used in math activities such as the elapsed time worksheets days, weeks, months, years also on this page. Although they are on a math worksheets website, our calendars may be used for many other purposes including for personal schedules, classroom planning, holiday calendars or any other use you see fit. One simple activity that can be done on the monthly calendars is to ask students to place a bingo chip or similar item on specific spots on the calendar e. After students become familiar with how a calendar is laid out and works, you can create more challenging activities like finding elapsed time, discovering the number of days in each month, scheduling activities, etc. Reading Time on Analog Clocks Reading time on analog clocks worksheets including various clock options for second hands and minute intervals. Even though the time is displayed digitally in so many places these daysâ€”on cell phones, on computers, on microwavesâ€”there are still quite a few analog clocks around. Besides being able to tell time on an analog clock, this is probably one of the first places that students encounter a number system other than base ten. Thanks to the Babylonians et. Once your students master the intricacies of the time system, they can start learning about other useful number systems like hexadecimal and binary, both of which are heavily used in computers. Suns and moons are included with each clock to indicate the time of day. Think of the moon as midnight and the sun as noon. If the clock has a sun on the left and a moon on the right, then the time is between midnight and noon AM in North America. The reverse means that the time is between noon and midnight PM in North America. If there are two moons or two suns, then the time is exactly midnight

Chapter 3 : How to count / calculate weeks / months / years between two dates in Excel?

If you've ever wondered how many weeks were in a year, or how many hours are in a month, we've got the answers! In fact, we've put together a nice little chart to ensure you'll easily be able to find any information you're looking for.

As is often the case in Excel, the same result can be achieved in several ways. Subtract one date from the other directly. As you probably know, Microsoft Excel stores each date as a unique serial number beginning with 1 that represents January 1. So, you are actually subtracting two numbers, and an ordinary arithmetic operation works without a hitch: When you subtract a more recent date 6-May from an earlier date 1-May, the subtraction operation returns a negative number -5 exactly as it should. Subtracting dates with Excel DATE function. If you prefer to supply the dates directly in the formula, then enter each date using the DATE year, month, day function and then subtract one date from the other. For instance, the following formula subtracts May from May and returns the difference of 5 days: If you are looking to count the number of months or years between two dates, then the DATEDIF function is the only possible solution and you will find a few formula examples in the next article that will cover this function in full details. There are a number of Excel functions suitable for this purpose, and which one you use depends on which unit you want to add or subtract. How to subtract or add days to date in Excel. If you have a date in some cell or a list of dates in a column, you can add or subtract a certain number of days to those dates using a corresponding arithmetic operation. Adding days to a date in Excel. The general formula to add a specified number of days to a date is as follows: As a cell reference, e. The current date at the moment of writing was 6 May, The result of the above formulas is a serial number representing the date. On the Number tab, select Date in the Category list, and then choose the date format you want. For the detailed steps, please see How to change date format in Excel. Subtracting days from a date in Excel. To subtract a given number of days from a certain date, you perform a usual arithmetic operation again. The only difference from the previous example is that you type the minus sign instead of plus: Date - N days. Here are a few formula examples: Adding weeks to a date in Excel: Subtracting weeks from date in Excel: Add months to a date with Excel DATE function. Taking a list of dates in column A for example, type the number of dates you want to add positive number or subtract negative number in some cell, say C2. Enter the following formula in cell B2 and then drag the corner of the cell all the way down to copy the formula to other cells: The logic behind the formula is obvious and straightforward. The DATE year, month, day function takes the following arguments: If you type a negative number in C2, the formula will subtract months instead of adding them: Naturally, nothing prevents you from typing the minus sign directly in the formula to subtract months from a date: Add months to date: It is available in modern versions of Excel, and upcoming Excel. Months - the number of months to add a positive value or subtract a negative value. The following formula used on our column of dates yields exactly the same results as the DATE function in the previous example: Dates should be entered by using the DATE function or as results of other formulas. To add months in Excel: To subtract months in Excel: Please see Changing the date format in Excel for the detailed steps. How to subtract or add years to date in Excel. Adding years to a date in Excel is done similarly to adding months. You use the DATE year, month, day function again, but this time you specify how many years you want to add: To add years to a date in Excel: To subtract years from a date in Excel: If you type the number of year to add positive number or subtract negative number in some cell and then refer to that cell in the DATE function, you will get a universal formula: Yep, using the good old DATE function: To add years, months, days: It lets you operate on time units hours, minutes and seconds exactly in the same way as you handle years, months and days with the DATE function. To add time in Excel: For example, to add 2 hours, 30 minutes and 15 seconds to the time in cell A2, you can use the following formula: Alternatively, you can enter the time units you want to change in some cells, and refer to those cells in your formula: Of course, such a formula can never exist. Select the cell in which you want to insert the formula. Depending on whether you want to add or subtract dates, switch to the corresponding tab, supply data for the formula arguments, and click the Insert Formula button. For this, you go to the Add tab, type A2 in the Enter a date box or click in the box and select the cell on the sheet, and type the number of months to add in the Month box. The wizard

makes a formula and shows its preview in the cell. It also shows the calculated date under Formula result: If you are satisfied with the result, click the Insert formula button. Once the formula is added, you can copy it to as many cells as necessary: For example, let us subtract some years, months, weeks and days from the date in A2. To have it done, switch to the Subtract tab and type the numbers in the corresponding boxes. Or you can enter the units in separate cells and supply references to those cells, as shown in the screenshot below: Clicking the Insert formula button inputs the following formula in A2: Additionally, you can click the Show time fields link and add or subtract date and time units with one formula. This is how you add and subtract dates in Excel. I am hopeful you have learned a couple of useful functions today. Anyway, I thank you for reading and hope to see you on our blog next week.
