

Chapter 1 : No Bake Fudge Cookies Recipe - An Easy Recipe Your Kids Will Love!

Enter your mobile number or email address below and we'll send you a link to download the free Kindle App. Then you can start reading Kindle books on your smartphone, tablet, or computer - no Kindle device required.

Ingesting foreign bodies is their way of exploring the world. Swallowing small items like buttons, batteries or coins seems a very common incident, and since coins are easily accessible by babies and toddlers, their shining metallic luster appeals the little eyes and as they like to taste everything, the silver metal goes straight into the mouth. Read how can you stop your baby from putting everything in his mouth. Children find everything as their potential food items and feed themselves with it. Then it may or may not be a food item. If it is small and fits into his mouth, it is definitely being tasted, and then maybe swallowed. A child will happily swallow a foreign object and not even worry about it. If your child has accidentally swallowed a penny or a coin, then you need to watch out and carefully observe the child. If the swallowed coin goes into the stomach, there is a huge possibility that the same will be passed through the colon and get expelled with stool. However, if the penny gets trapped in the passage to the stomach, it presents a risky situation and must be taken seriously. If the swallowed coin gets stuck in the esophagus, it could cause distinctive symptoms like

- The child could drop the saliva continuously from the mouth, continuous drooling can be indicative that something is wrong with the child
- Difficulty in swallowing anything, and so he may refuse food and drink even though he is hungry
- Vomiting can also be observed
- The child complains of pain in the neck or chest
- A sudden fever develops

If the coin gets stuck in the intestine and tears intestinal walls a variety of symptoms might be evident like- blood in the stool due to which it could appear dark, bowel sounds that are not normal, stomach pain and vomiting. Sometimes the coin gets trapped but a child can continue to swallow and eat without any difficulty. In such a situation, the child will cough continuously. The stuck coin can cause inflammation and irritation of the esophageal tissues, which can further rupture the esophagus, causing potential dangerous situations. Now you may be in a panic mode, because your child has swallowed a coin or some other foreign object. The coin passes through the digestive system and is expelled within a day or two. However, it is necessary to keep a keen eye on your child. It can be an emergency situation if there are the below mentioned symptoms:

- Your child cannot speak or cry, and has trouble breathing
- He is drooling and cannot swallow even food and water
- Your child is coughing or is breathing noisily
- You can feel him choking
- He loses consciousness and is vomiting continuously.

His stomach could also be upset If your child is doing well, and does not exhibit any symptoms, then you may as well wait for the penny to pass out through the stools. Though consulting a pediatrician is recommended, do not self medicate by giving laxatives to your child to hasten the process of excretion as it may not help. Neither will forcing your child to gulp food. If the coin has passed through the throat, into the stomach, it should pass out from the system in less than days, and usually within 2 days. A coin that is stuck will induce stomach or chest pain, drooling, trouble swallowing, vomiting and fever.

First Aid When Toddler Swallows a Penny If there are any symptoms of a coin or a foreign object being stuck, you must NOT

- Try to make the child vomit
- Give the child anything to drink or eat

You can follow the following steps if your child swallows a coin or something else that is soft, small, smooth and not poisonous: Make sure, you check his poop for next two to three days. This can be done by placing the poop in a strainer and spraying hot water on it. By doing this, you will be sure that the swallowed foreign object came out fine and there is no need to worry any further In the time period of swallowing coin it is necessary for parents to observe their child minutely Feed him food that is soft and fibrous. A hydrated body functions well and your child will have no trouble in passing stool with the coin in it

Swallowed Coin Treatment and Removal If the coin does not comes out even after following all the steps stated above and remains in the body for more than 48 hours, it is time to head to the hospital even if your child does not exhibit any symptoms of uneasiness. Visit your doctor and take medical help. The doctor may ask you to wait some more, and suggest some medicines for helping your child poop the coin out. Doctor will also help locate the exact position of coin in your child with the help of X-ray, and you can be certain that the object your child has swallowed is a coin only and nothing else. Though, there is no need to remove a coin with surgical

methods. Safety And Prevention Tips Here are some precautions you must take to avoid happening of such incidents. Do not let your child pay with money, not even bills. It is also a bad habit for children to play with money because they are passed through many hands and have thousand different types of bacteria and germs on them Do not let your child play with tiny objects. The chances of things getting inhales are also high, so better be cautious Practice extra caution if you are taking your child somewhere outside. Your child will examine things with his visionary senses and may want to explore his taste buds all over it.

Chapter 2 : Drop a dime | WordReference Forums

The play can begin at the drop of a dime, you just need to say the word. I have hired such nannies for my children at the drop of a dime, she is nothing special. You speak as if you have such talented people at the drop of a dime.

Walter, who died in January at the age of 83, spent decades working for Fred Trump, primarily helping computerize his payroll and billing systems. He had assumed this role by virtue of his close relationship to the family: Walter, it seemed to me, doled out bits of info in a somewhat gloating way. Donald Trump was master of his own narrative. That changed when Trump ran for president and soon Walter was the increasingly beleaguered target of an almost unending stream of media requests. By the time his cousin had become the surprise 45th president, Walter had all but resigned his unofficial job. No memos, he told his staff back in Trump Tower, a habit he may well have inherited from his father, who was legendary for keeping details in his head. But Walter, as the Times notes, kept things in his basement. Most notably, the documents include more than tax returns from Fred Trump, his companies and various Trump partnerships and trusts. When Fred was 12, his father, Friedrich, a fledgling real estate developer in Queens, died at 49 in the influenza pandemic. His widow, Elizabeth Christ Trump, got by with squeezing what she could from his holdings and taking in sewing, but she was determined to continue what he had started and came up with a long-range, family-oriented plan. In order to pull off this plan, the younger Elizabeth left high school early, not unusual at the time, and went to secretarial school; John began to study architecture; and Fred, who was taking courses in carpentry, plumbing and other construction skills, built his first structure, a garage for a neighbor. Because the children were under 21, their mother incorporated the new company under the name E. Unfortunately, the two brothers found it trying to work together. Fred wanted to sell the houses as soon as possible, regardless of whether they were completed, whereas John wanted to linger over the final details of each one. When Fred prevailed, John bailed and went on to a career in physics, but Elizabeth stayed put even after she married William Walter, a bank trainee, in June. But four months later, in October, the stock market crashed, the real estate market dried up, and Fred Trump was forced to suspend home building and open a food market in Queens. The career shift was only temporary. In , Fred deftly maneuvered his way into bankruptcy proceedings in federal court in Brooklyn that involved a large mortgage company. Through a series of inflated claims and side deals, the same strategy that Donald would use repeatedly decades later, he emerged with a mortgage-servicing contract that would put him back into real estate. This time, it was for good. He routinely submitted bids for projects like Beach Haven to the Federal Housing Administration on the basis of cost estimates, delivered the finished product for far less, and pocketed the difference—a practice that drew a harsh rebuke in the press and a subpoena to testify at a congressional hearing, but no actual penalties. He earned additional windfall profits from New York State housing programs with scams like setting up shell corporations from which he rented construction equipment at inflated prices. This brought more bad press and an appearance before a state commission, but no fines or criminal charges. Throughout these years, he constantly worked to make sure that his family never faced the same financial pressure that had confronted his mother and his siblings after his father died. Well before Donald Trump would meet Roy Cohn and embrace his do-whatever-you-can-get-away-with philosophy, Fred employed that same approach, making Donald a millionaire when he was in third grade and providing him a lifetime safety net that would protect him from the consequences of unwise moves and impetuous decisions. Donald also watched out for his cousin. But when Michael Kruse reached out to him in September for comment on another story, Walter sounded as if he were in no mood to cooperate with any kind of journalistic inquiry, much less one that alleged actual wrongdoing. He did sound somewhat nostalgic for the days before Trump entered politics. But right now, things are all screwed up. Gwenda Blair is the author of *The Trumps*: This article tagged under:

Put the toppings in small bowls. Dip the banana before each bite. Eat plain or roll or dip into any of the toppings. Use the wet topping first so the others will stick. Easy Homemade Popsicle Ideas And Recipes Making your own homemade popsicles can give great variety and keep your kids cool this summer! For non-traditional homemade popsicles: Freeze applesauce in popsicle molds. Mix fruit or jam into yogurt. Freeze in small, snack sized Ziploc bags for frozen yogurt on the go. Mix gelatin and freeze. Add gummie fish or worms before freezing for added fun. Freeze syrup from canned fruit. Add food coloring or sprinkles to yogurt or softened ice cream for added pizzazz. Then freeze in popsicle molds. Pour into popsicle molds and freeze. Make a batch of pudding. Add coconut, nuts, marshmallows, crushed cookies or sprinkles if desired. Freeze several hours until firm. Stick a toothpick in the center of blackberries, strawberries, raspberries or sliced bananas. Dip in chocolate if desired. Freeze on a tray. Once frozen, store in freezer bags. For easy snow cones, freeze orange juice or any other flavored juice in ice cube trays. Store frozen juice cubes in a plastic bag. Blend 5 cubes in the blender until they have a shaved ice consistency. The shaved ice will keep its consistency if kept frozen in a container. For watermelon homemade popsicles, blend one cup each watermelon chunks seeds removed , orange juice and water. Then pour and freeze into molds. For strawberry homemade popsicles, blend 2 cups strawberries, 1 cup vanilla ice cream or yogurt, 4 cups orange juice and 2 tablespoons sugar. Pour into molds and freeze. For banana homemade popsicles, dissolve one 3 oz. In a blender, mix gelatin, 1 banana and 1 cup yogurt or ice cream. Blend well and pour into molds. Stir in cold water. Pour in molds or paper cups and insert Popsicle stick. Mix and match to see what interesting new taste you can come up with. Lemonade Popsicles Mix your favorite batch of lemonade, whether fresh squeezed or made from a mix. Lemonade is refreshing itself but to have it in the form of a frozen treat can put you over the top. Let cool for 20 minutes, stirring a few times. Divide chocolate chips and peanuts between cups. Stir marshmallow creme into pudding. Insert Popsicle sticks and freeze.

Chapter 4 : Drop a dime | Define Drop a dime at calendrierdelascience.com

drop a dime noun I just heard a color commentator covering a college football game say of the Nebraska quarterback, who had just thrown a long touchdown pass, that he "dropped a dime on his receiver."

April 23, Why does a boat float but a nail sink? For those of you that know me well, you know that I love to sail. And so do my kids! If you drop a nail into a cup of water it sinks, right? Why do you think this is the case? The nail sinks because the density of the steel is greater than the density of the water. But ocean liners are made of steel so why do they float, and since they do float, why do they sometimes also sink? Buoyancy is the force that floats your boat. To understand buoyant force, think about what happens when you put an ice cube into your glass of water. As the ice cube displaces, or pushes away, some of the water it causes the level in the glass to rise and your ice cube to float partially in and partially out of the water like a miniature iceberg. Like a game of tug-of-war; gravity is pulling the ice cube down and buoyant force is pushing it up. How far in or out of the water your ice cube rests depends on its density, or solidness, because that is what the pushing and pulling forces are working against. A Greek mathematician and inventor named Archimedes noticed that when he stepped into his bathtub the water level rose. He reasoned that the weight of the water he displaced was equal to the buoyant force in the water. This is called Archimedes Principle and it applies to all fluids. Kids find it easy to remember Archimedes and his discovery when you ask them: You can learn more about Archimedes by visiting Science With Me! But back to the question of the hour! Why does a boat float but a nail sink? Ocean liners are made of steel and they float because their density is less than that of the water they float in. The ability of a boat to float depends on its average density. Average density takes into account not just the weight of the steel hull but also the air trapped in it. A ship with a large volume of trapped air has a lower density than that of the water it sits in so it floats. When a ship's hold is full of cargo it floats lower in the water because there is less trapped air making it denser. If the ship loses enough of its capacity to hold trapped air, it sinks. Remember the story about the Titanic? A submarine is designed to have almost the same density of the ocean water that surrounds it. In order for a submarine to sink the crew pumps water into tanks called ballast tanks. To surface the submarine forces the water out of the ballast tanks and fills them with air, lessening the density of the sub and bringing it up to the surface. Gravity, buoyancy and density work together to determine what floats your boat, or sinks your ship. Fill your kitchen sink with water and have each person make a boat out of aluminum foil and see if it floats high or low in the water. Have each person add pennies to their boat. Whose boat sinks first and why? Does the boat size influence the number of pennies it can carry? I hope this article helps you talk a little more science with your kid than you were planning to today. I am sure your kids love to ask you questions all the time too. And no doubt sometimes those questions can sink you!!

Trumpology. Did the Trump Family Historian Drop a Dime to the New York Times? A first cousin of the president kept a trove of financial records that appears to have provided evidence for a major.

Chapter 8 : Did the Trump Family Historian Drop a Dime to the New York Times? - POLITICO Magazine

If your child has accidentally swallowed a penny or a coin, then you need to watch out and carefully observe the child. If the swallowed coin goes into the stomach, there is a huge possibility that the same will be passed through the colon and get expelled with stool.

Chapter 9 : Five & Dime Kids

"At the drop of a dime" sure sounds like a mixture of "at the drop of a hat" with "to drop a dime on" (to snitch on). The phrase comes from the old cost of a telephone call (ten cents) by which a criminal could rat out his former friends.
