Elementary Classical Analysis (26) Designed for courses in advanced calculus and introductory real analysis, Elementary Classical Analysis strikes a careful balance between pure and applied mathematics with an emphasis on specific techniques important to classical analysis without vector calculus or complex analysis.

Teaching Manual Textbook List The textbooks below are always or sometimes used in the courses indicated. In some cases, different texts may be used in different sections of the same course. Textbooks in all courses numbered and above are chosen by the individual instructor. Please note that for courses numbered and below, all sections use the same textbooks. Testudo has been known to incorrectly say "No books listed yet" for some sections; if you see this, please check another section of the same course. Also, some textbooks listed in Testudo as "Recommended" are in fact alternative forms of the required texts. Some textbooks may be available only from the University Book Center, but most can be bought less expensively from online retailers. You are encouraged to explore this option, with the following caveats. You must order books with plenty of time to spare, because shipping or inventory delays may occur, especially near the start of the semester. Also, you must make sure you are buying the correct edition of a book. Delays or other problems with online orders are not grounds for being excused from class assignments. Abstract " When heterogeneous congestion control protocols that react to different pricing signals share the same network, the resulting equilibrium may no longer be interpreted as a solution to the standard utility maximization problem. We prove the existence of equilibrium under mild assumptions. Then we show that multi-protocol networks whose equilibria are locally non-unique or infinite in number can only form a set of measure zero. Multiple locally unique equilibria can arise in two ways. First, unlike in the single-protocol case, the set of bottleneck links can be non-unique with heterogeneous protocols even when the routing matrix has full row rank. The equilibria associated with different sets of bottleneck links are necessarily distinct. Second, even when there is a unique set of bottleneck links, network equilibrium can still be non-unique, but is always finite and odd in number. They cannot all be locally stable unless it is globally unique. Finally, we provide various sufficient conditions for global uniqueness. Numerical examples are used throughout the paper to illustrate these results. Show Context Citation Context The union of these open sets forms a cover for set E . Hence, the number of equilibria is finite. Proof of Theorem 4. By assumption A3, we can always find p_{\min} Proof of Theorem 5. We prove the existence of equilibrium in general multi-protocol We prove the existence of equilibrium in general multi-protocol networks under mild assumptions. For almost all networks, the equilibria are locally unique, and finite and odd in number. Finally, we show that if the price mapping functions that map link prices to effective prices observed by the sources are similar, then global uniqueness is guaranteed. I will focus my attention primarily on rigid body rotation and the Hopf fibration h :
