How to use bcdedit in windows 7 May 13th, Boot Configuration Data BCD files provide a store that is used to describe boot applications and boot application settings. The objects and elements in the store effectively replace Boot. It can be used for a variety of purposes, including creating new stores, modifying existing stores, adding boot menu parameters, and so on. BCDEdit serves essentially the same purpose as Bootcfg. Exposes a wider range of boot parameters than Bootcfg. Has improved scripting support. Below will give you a simple instruction about how to use bcdedit in windows 7. Type bcdedit and press enter ,then bcdedit will show the boot entries on your computer 3. The boot configuration data store contains boot configuration parameters and controls how the operating system is booted. These parameters were previously in the Boot. You can use Bcdedit. What is MBR and why it stops your Windows to start. Introduction to MBR Master Boot Record Master boot record is the first ever sector in your hard drive which will initiate the loading process of windows in your RAM and thus your windows will boot up. It will hardly contain the list of files to be loaded to initiate the loading process of windows. Below there is image Image source: Where C drive start, where MBR is located and all. The process of Booting of windows operating system involves the following: This will scan your drive and will ask you which OS is to repair, if you have one OS, it will be selected by default, Press Next. Please wait, since this may take a while Successfully scanned Windows installations. Total identified Windows installations: Share this with your friends, link to this post on Forum and Facebook twitter and solve the problem of those your love once. It can be quite common if you have more than one hard drive installed in your computer and your BIOS gets reset. Usually you can access your BIOS seconds after your computer turns on by pressing the Delete button or by pressing a specific function key. Once in the BIOS, check to see that your system drive is listed appropriately in the boot order sequence; you may need to refer to your motherboard manual for help. Another possible reason for Windows not being detected upon start up is a hardware issue. If your BIOS is unable to detect your system drive, check to make sure all the cables are plugged in properly. If your hard drive is making an odd noise, such as a clicking sound, your hard drive may be broken. Finally, it is possible that the hard drive is having data corruption issues, which has damaged important system data, such as the Master Boot Record MBR. If you suspect a faulty hard drive, it may be a good idea to backup and scan your hard drive for errors from another computer and possibly consider buying a replacement. Trying to repair a boot problem on a damaged drive can possibly lead to even more data loss, so backup your data before attempting anything. The MBR and other important boot data can also be damaged by trying to install an earlier version of Windows, such as Windows XP, alongside Windows 7 and by third-party programs, such as viruses. In the case of a virus, it is recommended that you run a virus scan of the drive before attempting any repairs as otherwise it could lead to more data loss. It is further possible to achieve the appearance of damaged boot data by having the wrong drive partition set to active, which can be the outcome of an overly curious Windows user with administrative permissions. If you do not have a Windows 7 Installation DVD however, you can alternatively use a Windows 7 System Recovery Disc, which we will show you how to create further down in this article. If you do not yet have either a Windows 7 Installation DVD or a recovery disc, do yourself a big favor and make a recovery disc right away to avoid any unnecessary headaches down the road. After the installation or recovery disc loads, if prompted, select your language settings and then continue. If you are using the installation DVD, when prompted by the following screen select Repair your computer. The computer will take a moment now to scan itself for any Windows installations, after which you will likely be given a choice to select which installation you wish to repair. Select the appropriate Windows installation from the list and then continue. If by chance a problem is detected in one of your Windows installations at this initial stage, the system may also ask you if it can try to repair the problem automatically. It is up to you if you wish to let the system try to repair itself, but otherwise just select No. Once you have reached the System Recovery Options screen, as shown below, you will be faced with a list of choices that can aid you in repairing a damaged Windows 7 operating system. If you wish to try the Startup Repair option first, it is often successful in automatically fixing many different start up issues, but in this article we will be using the Command Prompt option to resolve our problems manually. So, click Command Prompt to continue. Now sitting at the command prompt, enter the following command and then press enter: If successful, you should be greeted with the message The operation completed successfully. Your Master Boot Record has been repaired. This might occur if you have tried to install another operating system alongside Windows 7, such as Windows XP. To write a new boot sector, try the following command: It is a common mistake to make when playing with partitions on a system drive and it can be a headache to solve if

not prepared. To change your active partition back using the Windows 7 recovery disc or Installation DVD, follow the steps below. Follow steps one to four in the above guide. Type DiskPart and then press Enter. Type List Disk now and then press Enter. This command will list all disks attached to your computer and assign them a disk number. Type Select Disk x, where x is the number for the disk containing the partition you wish to make active. Type List Partition and then press Enter. You will now be shown a list of the partitions on the selected disk. Determine which partition you wish to make active. Type Select Partition x, where x is the number of the partition you wish to make active. Now, just type Active and then press Enter. That should be it - the selected partition is now active. Click Create disc and let the program do its thing. It only needs to write about 100 megabytes to the disc, depending on whether your OS is 32 bit or 64 bit, and that should only take a minute. Using a Windows 7 Installation DVD at step seven will also allow you to install Windows 7 via USB, not just recover a damaged system; very useful if you have a netbook! Open a command prompt with administrative rights. After accepting any UAC verification questions, you should now be at the command prompt. Type List Disk and then press Enter. Determine which disk number corresponds to your USB flash drive. Enter the following commands in order, changing the disk number to the disk number listed for your USB drive. Warning - the following commands will erase everything on your USB drive or the disk you select. After DiskPart successfully formats the USB drive, which might take a few minutes, you will want to enter the following commands: There should be two folders and a file in the ISO image that need to be copied. You can download WinRAR from [here](#). Now that the files are copied, we will want to make the USB drive bootable. To accomplish this however we will need to download a small file called bootsect. Once downloaded, place the bootsect. Back at the command prompt, we will want to change the current directory to that of the USB drive and run the bootsect command. In our case this is drive E, so we will be using the following respective commands: The bootsect command will update the target volume with a compatible bootcode. Usually, you will encounter the dreaded error message: But how to access the command line tool without operating system in the first place? You may have to change your boot order to boot from DVD! Click on "Repair your computer": The installer will scan your PC for previous Windows installations: Click on Command Prompt Enter the following command on one line: Next, Windows 7 will automatically search for errors. At the bottom you will see the "Command Prompt" tool. Enter the command bootrec. System Recovery tool in Windows 7 allows you to recover the previous files that might have been altered by installation of a new software, game or similar stuff. Sometimes mischievous viruses are cause of Master Boot Record Malfunction.
