Verified Purchase This board is both good and not so good. Be very careful on case selection. You will need a case that opens on both sides. Because when you install your graphics card I used a GTX ti it will cover the upper two SATA connects leaving you with only the four lower that you can access from the usual door. You have to have the other side-door available for connecting and disconnecting the top two. Also the front memory slot latch partially interferes with the right top screw-hole so if you have a compact CoolerMaster case like I did you will have a tough time placing and tightening the top right MB screw. There is almost no room at the top with this case and a top-mount fan was impossible especially with this mother board. As mentioned the SATA hookups face the front of the computer turned sideways from you as you have your main side-door open to work on the MB. On the plus side the Corsair Mhz memory was read and compatible and did not interfere with the Zalman LED CPU air-cooler that was installed with the fan blowing air towards the rear-fan. The Corsair Vengeance has very tall black heat-spreaders. In fact with the Zalman cooler facing rear I could have filled all four memory slots with the tall memory sticks. Remember that some coolers will not allow this on this motherboard as the memory slots are extremely close to the CPU mount. Do not use Artic Silver for your CPU installation unless you are extremely good in your hand and eye dexterity. Artic Silver is conductive and will short out your cpu and board if too much is supplied. Artic Silver will also dry out in a couple years and need to be redone. There is no usb 3. Some flash-card reader front panels have 3. I do not like to have cables sticking out the rear-case if I can help it. I liked that the Gigabyte MB disk installs drivers without any problems. There is a Norton Internet Security that is good for 60 days and I did not bother as I had already bought the software. If you order I hope you get the newer board too. One last thing, there are less screw-holes on this MB and so it will overhang its support screws that it has. So when you install your main power supply make sure you hold the board up towards yourself so you will be able to push the connection in firmly without bending and damaging your motherboard. I wish you all a successful build without headaches.
