Power Glove " an alternate controller for use with the Nintendo Entertainment System Wheelchair gloves " for users of manual Wheelchairs Main article: Satin and stretch satin are popular and mass-produced. Some women wear gloves as part of "dressy" outfits, such as for church and weddings. In Japan , white gloves are worn frequently. Work-oriented white gloves are worn for activities such as gardening and cleanup; "dress" white gloves are worn by professionals who want a clean public appearance, such as taxi drivers, police, politicians and elevator operators. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. Fingerless gloves are often padded in the palm area, to provide protection to the hand, and the exposed fingers do not interfere with sensation or gripping. In contrast to traditional full gloves, often worn for warmth, fingerless gloves will often have a ventilated back to allow the hands to cool; this is commonly seen in weightlifting gloves. Fingerless gloves are worn by motorcyclists to better grip the handlebars, as well as by skateboarders and rollerbladers , to protect the palms of the hands and add grip in the event of a fall. Some anglers , particularly fly fishermen, favour fingerless gloves to allow manipulation of line and tackle in cooler conditions. Fingerless gloves are common among marching band members, particularly those who play the clarinet or open-hole flute, due to the difficulty of covering small holes whilst wearing gloves. The lack of fabric on the fingertips allows for better use of touchscreens , as on smartphones and tablet computers. Professional MMA fighters are required to wear fingerless gloves in fights. Leather gloves[ edit ] Lined black leather gloves with red leather fourchettes A leather glove is a fitted covering for the hand with a separate sheath for each finger and the thumb. This covering is composed of the tanned hide of an animal with the hair removed , though in recent years it is more common for the leather to be synthetic. Common uses[ edit ] Leather gloves have been worn by people for thousands of years. The unique properties of leather allow for both a comfortable fit and useful grip for the wearer. The grain present on the leather and the pores present in the leather gives the gloves the unique ability to assist the wearer as they grip an object. As soft as a leather glove may be, its pores and grain provide a level of friction when "gripped" against an item or surface. A common use for leather gloves is sporting events. In baseball , a baseball glove is an oversized leather glove with a web used for fielding the ball. Leather gloves are also used in handball , cycling , and American football. Early Formula One racing drivers used steering wheels taken directly from road cars. They were normally made from wood, necessitating the use of driving gloves. For example, beekeepers use leather gloves to avoid being stung by bees. Construction workers might use leather gloves for added grip and for protecting their hands. Welders use gloves too for protection against electrical shocks , extreme heat, ultraviolet and infrared. Criminals have been known to wear leather gloves during the commission of crimes. Gloves are worn by criminals because the tactile properties of the leather allow for good grip and dexterity. These properties are the result of a grain present on the surface of the leather. The grain makes the surface of the leather unique to each glove. Investigators are able to dust for the glove prints left behind from the leather the same way in which they dust for fingerprints. Because it is a natural product, with its own unique variations, every piece has its own individual characteristics. As this occurs the leather of the glove will become more malleable, and thus softer and more supple. Overtime wear spots may appear on certain parts of the palm and fingertips, due to the constant use of those areas of the glove. Because the leather is natural as well as delicate, the wearer must take precaution as to not damage them. The constant handling of damp or wet surfaces will discolor lighter-colored gloves and stiffen the leather of any glove. The wearer will often unknowingly damage or stain their gloves while doing such tasks as twisting a wet door knob or wiping a running nose with a gloved hand. It is common attire in leather subculture and BDSM communities. Lambskin is widely used for fashion gloves and it is casual and country gloves. It is the most used material for gloves made in Europe in the known as French style. Cowhide is often used for lower-priced gloves. This leather is generally considered too thick and bulky for the majority of glove

styles, particularly finer dress gloves. It is, however, used for some casual styles of glove. Deerskin has the benefit of great strength and elasticity, but has a more rugged appearance, with more grain on the surface, than "hairsheep". It is very hard-wearing and heavier in weight. Goatskin is occasionally used for gloves. It is hard-wearing but coarser than other leathers and is normally used for cheaper gloves. Hairsheep originates from sheep that grow hair, not wool. Hairsheep leather is finer and less bulky than other leathers. Its major benefits are softness of touch, suppleness, strength, and lasting comfort. It is very durable and is particularly suited for the manufacture of dress gloves. Peccary leather is very soft, difficult to sew, and hard-wearing. It is very warm in cold weather, and as a leather reversed, it has still attached wool on the inside. Slink lamb is used only in the most expensive lambskin gloves. Some of the finest lambskin comes from New Zealand. November Learn how and when to remove this template message Cashmere is warm, light in weight, and very comfortable to wear. Cashmere yarn comes from the hair of mountain goats, whose fleece allows them to survive the extreme weather conditions they are exposed to. Wool is well known for its natural warmth and comfort, as well as having a natural elasticity. Other linings, which include wool mixtures and acrylics.

Component parts[ edit ] The component parts that may be found in a leather dress glove are one pair of tranks, one pair of thumbs, four whole fourchettes, four half fourchettes, two gussets, and six quirks. Depending on the style of the glove there may also be roller pieces, straps, rollers, eyelets, studs, sockets and domes. Finally, linings will themselves consist of tranks, thumbs and fourchettes. Stitching[ edit ] The most popular types of leather glove sewing stitches used today are: Hand stitching is a very time-consuming and skilled process. Fourchettes are the inside panels on the fingers of some glove styles. Perforations are small holes that are punched in the leather. They are often added for better ventilation, grip, or aesthetics and can be as fine as a pin hole. Points are the three, or sometimes single, line of decorative stitching on the back of the glove. Quirks are found on only the most expensive hand sewn gloves. They are small diamond shaped pieces of leather sewn at the base of the fingers, where they are attached to the hand of the glove to improve the fit. A strap and roller is used to adjust the closeness of the fit around the wrist. They provide a good feel and protect the hands. They are designed to be worn tight and to not interfere with hand movements. The increased grip allows for more control and increased safety at speed. Made of soft leather, drivers gloves are unlined with external seams.

History[ edit ] Since the advent of fingerprint detection, many criminals have resorted to the wearing of gloves during the commission of their crimes in order to avoid leaving their fingerprints as evidence. In the era prior to contemporary advances in forensic science , the simple act of covering the hands often assured criminal assailants their anonymity if no witnesses were present during their offenses; thus a pair of gloves became the most essential and crucial tool for any successful perpetrator. Often in earlier decades these smudges were ignored because very little of their detail was retrievable. With the advent of latent fingerprint detection in the late 20th century, investigators started to collect, analyze, and record prints left at crime scenes that were created by the wearing of gloves. Glove prints can be as simple as marks caused by seams or folds in fabric of a glove, or they can be as complex as marks left behind by the grain or texture of the fabric of a glove. When gloves are collected as evidence their prints can be taken and compared to glove prints that were taken at crime scenes or from evidence. If when either a fingerprint is able to pass through a glove, or when, because of holes in a glove, finger and glove prints appear together, investigators are now able to better distinguish between prints made by friction ridges and prints made by gloves. Many times this also happens because criminals also opt to wear gloves that are both tight-fitting and relatively short, which makes the occurrence of prints being made by the butt of the palm and the wrist palm prints more common as the gloves may slip, thus exposing areas of the skin that may leave prints. Today, latent fingerprints first discovered on the surfaces of fabrics by investigators in the s , [5] as well as DNA and incriminating bacteria can also be recovered from the inside of these discarded gloves. Glove-prints were found on a broken window and were later matched to the gloves of a suspect. Leather gloves that are thin and tight-fitting provide both enhanced gripping and dexterity to the wearer. When discovered by authorities, latent fingerprints may also be recovered from the inside of these gloves. Lined leather gloves may leave a print that is as unique as a human fingerprint. Thin, latex , rubber , plastic , vinyl or nitrile gloves: These gloves are worn by criminals because of their tight, thin fit that allows the hands to remain dexterous. These gloves are worn by criminals because the tactile properties of the leather allow for good grip and dexterity. These properties are the result of the grain present on the surface of the glove. The grain makes the surface of the leather unique to each glove. Over time, the pores and grain of leather gloves will pick up dirt and grease from surfaces that they have touched or handled. The dirt and grease can in return help to create prints on surfaces. This helps to increase the gripping properties of the gloves [19] but causes the gloves to leave prints. These gloves are worn by criminals because they are typically inexpensive and readily available as well. Weave patterns of fabric gloves may also be unique to that glove and when collected at a crime scene, can be compared to gloves that are taken in as evidence. Like leather gloves, these gloves will over time pick up dirt and grease as well. For the same reason baseball players wear these gloves, to improve their grip while maintaining dexterity while batting, assailants wear these gloves as to maintain dexterity and be able to grip easily during their offenses. In , Rochester, New York law enforcement was responding to a reported burglary when they arrested a suspect who was fleeing the burglarized home. On his person, investigators found a yellow rubber glove that was later found to match glove prints that were found on property that was known to have been stolen from the home. Law enforcement later found the perpetrator hiding in the complex and collected items that the perpetrator was hiding with him. No fingerprints were found but latent glove prints were found with the use of fingerprint powder. A particularly detailed hand print of a leather glove became visible at the break-in point of one burglary. After a group of suspected burglars were brought in, the investigators received a warrant to search a vehicle that was linked the suspects. A brown leather batting glove was recovered that seemed to match the stitch detail on the glove prints taken from the break-in point. After scanning both the palm of the leather glove and the recovered glove print into a computer, the investigators used Adobe Photoshop software to compare the grain detail of the glove with the grain detail of the glove print. The investigators were thus able to match the stitching and

grain detail of both, thus incriminating the suspects. While in custody investigators compared the gloves that the suspect had in his possession to glove prints that were found at several break-in locations. Investigators were able to link marks left on a window to his gloves. The impressions left by the gloves seemed to possess indentations made by letters "M", "e", and "c" which would have been present on the surface of the gloves. Authorities were later able to match these unique impressions to Mechanix-brand gloves that were found at the residence of a suspect. Residents who had their firearms seized also found glove marks on conspicuous places such as bedroom furniture, where guns were thought to be stored. The Journal and Record: The Law and The Lawyers.
