Gold Rush Nuggets sells natural gold nuggets and gold in quartz specimens. Our videos highlight some of the beautiful natural gold nuggets that we have sold.

It has probably something to do with so much gold being found at the same time, often with relative ease. Gold nuggets can be found in alluvial deposits sediments formed by water movement or in other placer deposits formed by other movement, but gold nuggets can also be found in or close to primary gold deposits, for example gold lodes or veins which have been exposed by the weather. Obviously, not all of these claims can be true. There are also a number of "largest gold nuggets" lists which confusingly mix historical nuggets which no longer exist alongside nuggets which still exist. We think a list of gold nuggets which still exist is more accurate, since many historical nuggets are now just legends and have long since been melted down into gold bars or gold coins. The Serra Pelada has essentially been closed since the late s and gold mining is no longer possible due to flooding and government prohibitions. Serra Pelada gold rush, Para, Brazil, s 2. It has a gross weight of When found, it was dug up from a depth of about 3. This gold nugget has the distinction of being the largest gold nugget ever found using a metal detector. The Normandy Nugget was purchased from the finder in by Normandy Mining, which is now part of Newmont Gold Corporation, and the nugget is currently on display in the museum of the Perth Mint based on a long-term agreement with Newmont. The gold was found embedded in quartz rock, however through a cleaning process involving hydrofluoric acid, most of the quartz was removed to reveal a single mass of gold weighing 44 troy pounds Gold and California have been interlinked since the famous northern California gold rush of the late s - early s. A list of these gold nuggets can be seen here. Three of these additional gold nuggets are listed with gold content weights of Technically these other Brazilian gold nuggets from Serra Pelada would push both the Australian nuggets and the Ironstone nugget down the list. This gold nugget weighed approximately However, "The Welcome" was subsequently shipped to England and melted down by the Royal Mint in to fabricate Gold Sovereign coins. Replicas of "The Welcome" can still be seen today in a number of Australian museums. Reports as to its weight vary but are consistently above 70 kgs of gold content. Within a few days of it being found, the Welcome Stranger was cut up, melted down into ingots, and shipped to the Bank of England via Melbourne. However, a replica of the Welcome Stranger nugget can still be seen today at the City Museum in Melbourne.

Formation[edit] A large gold nugget from Nevada County , California Nuggets are gold fragments weathered out of an original lode. A study on Australian nuggets ruled out speculative theories of supergene formation via in-situ precipitation, cold welding of smaller particles, or bacterial concentration, since crystal structures of all of the nuggets examined proved they were originally formed at high temperature deep underground i. A later study of native gold from Arizona , US, based on lead isotopes indicates that a significant part of the mass in alluvial gold nuggets in this area formed within the placer environment. Gold nuggets in Australia often are 23K or slightly higher, while Alaskan nuggets are usually at the lower end of the spectrum. Purity can be roughly assessed by the nugget color, the richer and deeper the orange-yellow the higher the gold content. Nuggets are also referred to by their fineness , for example " fine" means the nugget is parts per thousand in gold by mass. The common impurities are silver and copper. Nuggets high in silver content constitute the alloy electrum.
