

Chapter 1 : How to Use wow js in html template bangla tutorials | Techno Center

<https://calendrierdelascience.com> In this video i explain what is HTML5 and CSS3 are as well as show you what you need to follow along with the rest of the series.

It does not explain much of CSS. At the end of the tutorial, you will have made an HTML file that looks like this: Once you understand the principles, you may want to switch to more advanced tools, or even to commercial programs, such as Style Master, Dreamweaver or GoLive. But for your very first CSS style sheet, it is good not to be distracted by too many advanced features. They typically make files that a Web browser cannot read. So far it contains the title of the document, but later we will add the CSS style sheet there, too. The browser will ignore it. But just a few words about the structure of our example HTML page. Presumably, all pages on our site have a similar menu. But you may add them, if you prefer. As is common for current Web pages, this one has a menu that links to other pages on the hypothetical site, some unique content and a signature. Newer versions of TextEdit will notice the. Next, open the file in a browser. You can do that as follows: It should open in your default Web browser. If it does not, open your browser and drag the file to it. As you can see, the page looks rather boring. Step 2: So one easy thing we can do to make the page more stylish is to add some colors. Leave the browser open, we will use it again later. We will start with a style sheet embedded inside the HTML file. Separate files is good, since it makes it easier to use the same style sheet for multiple HTML files: But for this step, we just keep everything in one file. The style sheet will be inside that element. So go back to the editor window and add the following five lines in the head part of the HTML file. The lines to add are shown in red lines 5 to 9. The third line sets the color of the text to purple and the next line sets the background to a sort of greenish yellow. Style sheets in CSS are made up of rules. Each rule has three parts: The example shows that rules can be combined. We have set two properties, so we could have made two separate rules: The background of the body element will also be the background of the whole document. We will add some other colors later. Apart from the list of links at the top, the text should now be purple against a greenish yellow background. How one browser shows the page now that some colors have been added. Colors can be specified in CSS in several ways. This example shows two of them: There are about color names and the hexadecimal codes allow for over 16 million colors. If Helvetica is absent, Geneva, Arial and SunSans-Regular are quite similar in shape, and if none of these work, the browser can choose any other font that is serif-less. In the text editor add the following lines lines and Georgia, "Times New Roman", Times, serif; color: Now the main text has a different font from the heading. Many Web sites have some sort of menu along the top or on the side of the page and this page should have one as well. We will put it on the left side, because that is a little more interesting than at the top. The menu is already in the HTML page. On a real Web site, there should not be any broken links, of course. So we need to move the list to the left and move the rest of the text a little to the right, to make room for it. There are other ways to do it. But this one is OK for our purposes. In the editor window, add the following lines to the HTML file lines 7 and The main text has been moved over to the right and the list of links is now to the left of it, instead of above. In this case, 2em from the top and 1em from the left side of the window. Most browsers have a menu for increasing or decreasing the font size: Styling the links The navigation menu still looks like a list, instead of a menu. No particular reason, just because we can. Usually, the colors are similar to what we specified here: But if our site grows we probably want many pages to share the same style. There is a better method than copying the style sheet into every page: To make a style sheet file, we need to create another empty text file. In the new editor window, you should now have the complete style sheet: Now go back to the window with the HTML code. If you save the HTML file and reload it in the browser, you should see no change: The final result The next step is to put both files, mypage. Well, you might want to change them a bit first. But how to do that depends on your Internet provider.

Chapter 2 : Web Design - Training with Live Project

DOWNLOAD PDF HTML AND CSS BANGLA TUTORIAL

this is my 1st tutorial on html and calendrierdelascience.com tutorial will be help you to start your html and css at a calendrierdelascience.com calendrierdelascience.come for next tutorial.
