

Chapter 1 : Open a URL in a new tab (and not a new window) using JavaScript - Stack Overflow

Now when your visitors click that link, it will open in a new window or tab (depending on which web browser they are using and how they configured that browser). Note that if your web page uses the "strict" DOCTYPE of XHTML or , you will not be able to do the above and still have your page validate as correct.

This article answers that question. Prerequisites Since the visitor did not specify which web editor he was using, I will assume here that he is working directly in HTML. Note that this does not mean you cannot follow this tutorial if you use a visual web editor , or if your website uses some sort of blogging software. It merely means that you will need to somehow access the HTML code of your page so that you can modify it. Most web editors and blogging software allow you to do this. For example, if you have a link that says the following: This is an erroneous assumption. If someone clicks on a link and wants to return to your site, they will simply hit the Back button on their browser. Most people, even non-computer-geeks, learn this feature of their browser within a short time of discovering the Internet. The power users learn, in addition, how to right click a link and select "Open in a new tab" or window when they need a link to be displayed in a separate tab or window. When you create links that open in a new window, you are actually preventing newcomers from returning to your website. You may think that they will know how to simply switch back to the original window. My experience with such people suggests otherwise; they are stymied by the Back button not working, and are not even aware that they are looking at a new tab or window. The situation is not better with experienced users. While they can figure out that they are looking at a new tab or window, and can switch back, they tend to get very irritated at your site for opening windows without their permission. After all, they are power users: This kind of attack is called "phishing". Even if your site does not have facilities for visitors to log in, the linked-to site can replace it with a page that delivers malware. This vulnerability is not hypothetical. The people from the Google Security Team have noted a "significant number of reports" of such "tabnabbing" being used to deliver malware. Technical details only for those who are interested: It has a property called window. With this added, the above example becomes: Since the list of browsers that support either attribute is not identical, if you want this protection from the greatest subset of browsers possible, you will probably need to use both. That said, the workaround only helps with the later versions of Chrome, Firefox and Safari. Internet Explorer does not have such a facility, although from my cursory test, version 11 seems to be immune to the attack in its default security zone. Conclusion My general recommendation is to avoid opening links in a new window or tab, if possible. Of course there may be specific instances where this is needed which is why such a facility exists in the first place, for those rare cases where it may be required. Chapter 2 : Make Sure Links Open in a New Tab/Window | SurveyGizmo Help

Most modern browsers will, by default, open in a new tab. Older browsers, such as the IE hoard, will open in a new window - either because they don't have a tabbed feature, or because their default behaviour is a new window.

Chapter 3 : links list to open in new tab

It may seem to work, because a new window or tab will probably be opened when none exists with the name 'blank', but a second click on the link should open the page in that same tab again instead of opening yet another one.

Chapter 4 : html - Open link in new tab or window - Stack Overflow

@JeanGkol I rewrote my answer to clarify the issue. Technically, it is working, because it opens a new browsing context

DOWNLOAD PDF HTML OPEN IN NEW TAB NOT

(like it is supposed to do). The problem is, that in modern browsers "browsing context" is a tab instead of a window (you can change this in the settings though).

Chapter 5 : firefox - JavaScript open in a new window, not tab - Stack Overflow

Automatically open html links in new tab [closed] Ask Question. up vote-3 down vote favorite. 1. Open a URL in a new tab (and not a new window) using JavaScript.

Chapter 6 : javascript - Automatically open html links in new tab - Stack Overflow

The target-new property specifies whether new destination links should open in a new window or in a new tab of an existing window. Note: The target-new property only works if the target-name property creates a new tab or a new window.

Chapter 7 : html - Make a link open a new window (not tab) - Stack Overflow

There actually IS a need for links to open in a new windows sometimes. I am designing and coding a site which collects data from users which requires them to upload files (images and pdf documents).

Chapter 8 : How to open URL in a new tab? NOT in new window! | Adobe Community

The question is specifically in regard to forcing a new window to open rather than a tab, and as the MDN article for [calendrierdelascience.com\(\)](#) indicates, it is unlikely the behavior will be as desired in a modern browser, though this would seemingly be the most straightforward JS to open a window.

Chapter 9 : How to Make Links Open in a New Window or Tab (calendrierdelascience.com)

Hi Sri, Seems like you didn't get the point in the screenshot which is showing up with "new window" selected rather "new tab". Even when "new window" option is selected, report is getting opened in the new tab.. so there is no additional setting selected over here.
