Alphabetical Co-operating Organisations The IEE acknowledges the contribution made by the following organisations in the preparation of this guide. The scope generally follows that of BS . It includes material not included in BS , provides background to the intentions of BS , and gives other sources of information. However, this guide does not ensure compliance with BS . It is a simple guide to the requirements of BS , and electricians should always consult BS to satisfy themselves of compliance. It is expected that persons carrying out work in accordance with this guide will be competent to do so. It cannot be guaranteed that BS complies with all relevant Regulations and it is stressed that it is essential to establish what statutory and other Regulations apply and to install accordingly. It is essential to prepare a schedule of the work to be done prior to commencement or alteration of an electrical installation and to provide all necessary information and operational manuals of any equipment supplied to the user on completion. Any specification should set out the detailed design and provide sufficient information to enable competent persons to carry out the installation and to commission it. The specification must include a description of how the system is to operate and all of the design and operational parameters. The specification must provide for all the commissioning procedures that will be required and for the production of any operational manual. It must be noted that it is a matter of contract as to which person or organisation is responsible for the production of the parts of the design, specification and any operational manual. The persons or organisations who may be concerned in the preparation of the specification include: Often, such as in a speculative building, the detailed intended use is unknown. The operational manual must include a description of how the system as installed is to operate and all commissioning records. Guidance on the preparation of technical manuals is given in BS Specification for technical manuals and BS Recommendations for the presentation of technical information about products and services in the construction industry. The size and complexity of the installation will dictate the nature and extent of the manual. It covers the following installations: Advice is given on installations in locations containing a bath or shower 8. Part 6 This Guide is restricted to installations: Earth return via sheath TN-S system: This Guide introduces the use of conventional circuits, which are discussed in Section 7. Because of simplification this Guide may not give the most economical result. This Guide is not a replacement for BS , which should always be consulted. Defined terms according to Part 2 of BS are used in this Guide. For convenience in use, and in accordance with current UK manufacturing practice, the Part 2 terminals of electrical equipment shown in Figs Further information is available in the series of Guidance Notes published by the Institution. For new domestic installations and major refurbishments account should be taken of the recommendations in Approved Document B, issued as guidance on the Building Regulations Part B1, Section 1 advises that, if dwellings are not protected by an automatic fire detection and alarm system to Part 6 of BS , a suitable number of mains operated self-contained smoke alarms to BS be installed. Polarity should be indicated by the colour of the insulation and the minimum cable size should be 25 rnrn-, The distributor may specify the maximum length and the minimum cross-sectional area see 1. Layout when the supplier does not provide a main switch Note: Earthing arrangements have been omitted for clarity. Layout when the supplier does provide a main switch Note:
