The main focus of the activity is for them to add a volume of 10ml of rubbing alcohol with 10ml of DI water. The traditional student will expect these volumes to add up to 20 ml. However, due to the molecular structure of each substance, the volume will be less than 20ml.

Classroom email summaries for guardians This article is for guardians. Teachers go here or Students go here. You can only receive summaries for students with school accounts. You can choose the frequency of the emails, such as daily or weekly. You can unsubscribe or remove yourself from Classroom at any time. Guardian email summaries include: You have days to accept an invitation before it expires. The teacher or administrator emails you an invitation for a particular student. In your email program, open your email invitation. Optional To access the email summary settings page, create a Google Account. When you accept an invitation, you, your student, and the person who invited you the teacher or administrator receives an email confirmation. If you have a Google Account: Click Unsubscribe again to confirm that you want to permanently remove yourself as a guardian. The student receives an email that you were removed from their account. Option Two - use the SUM() function to add up a range of cells The SUM() function is a much more efficient way to add up cells. It can be used to add up individual cells, as we did in the last example.

This lesson shows you several methods including the SUM function and the Autosum button. Notice how the cells in my formula have been highlighted as I typed my formula: When I press Enter, the formula will be stored in the cell, and the result of the formula will be displayed as shown in the example below: Note that if one or more of the cells are empty, or contain text rather than a number, Excel will simply ignore those values when calculating the result. In other words, typing this: The great thing about adding up cells in this way is that the formula will always show the current value of the sum of these cells. Of course, this approach to adding up cells becomes difficult to manage once you have a large number of cells to be added. It can be used to add up individual cells, as we did in the last example. It is particularly powerful because it can be used to write a simple formula add up hundreds or thousands of cells. Notice how the cells included in the formula are highlighted - this is a useful way to check whether your formula is using the correct range of cells for its calculations. This formula adds up all the cells from B2 to B6 inclusive. This method could be used just as easily to add up several thousand cells, as shown in this example: You could also use it to add up a row of numbers, such as this example: You can also use it to add up cells in more than one row and more than one column at a time, as shown in this example: Finally, you can add up more than one range of cells at at time. This example adds up several ranges at once. All the cells in all the ranges are added together to give a grand total: As you can see, this formula specifies three separate ranges, each of which will be included in the same SUM calculation. This brings us to one final example of how to use the SUM function. This is a common mistake made by new Excel users, and it can quickly become a bad habit:

Chapter 3 : Does It All Add Up?

Note that since the above bundles are actually just the combined stand-alone prices for all the DLC, and only the SMM stage (which had a lot of unusual elements) broke the normal \$ character + stage, \$ character, \$ stage, we should be able to estimate the price of everything else.

Does It All Add Up? Dana Damm, Henning High School, Henning MN Summary In this chemistry classroom lab activity, students will be exploring the molecular properties of different substances. The lab is structured to surprise the students and encourage critical thinking. The main focus of the activity is for them to add a volume of 10ml of rubbing alcohol with 10ml of DI water. The traditional student will expect these volumes to add up to 20 ml. However, due to the molecular structure of each substance, the volume will be less than 20ml. It will be around 19 ml. Imagine putting rocks into a jar and then pouring sand in around them. The sand works its way into the gaps made by the larger rocks. This is the same principle as the lab in focus here. The smaller alcohol fits into the gaps made by the larger water molecules. Learning Goals This lab focuses on inquiry, critical thinking, making measurements, and understanding the "unseen" world of science. It teaches students that it is important to think critically instead of jumping to their first conclusion. It teaches students to make careful measurements and most importantly, it challenges them to think and argue amongst themselves. Context for Use This lab can easily be accomplished in a 50 minute period. This works well as an introductory lab to get students thinking. It requires little previous knowledge. This activity would work well for any age group over 7th grade. The only hazard would be working with the rubbing alcohol as well as the glass graduated cylinders. High School Description and Teaching Materials I use this lab as in introductory activity for my chemistry course. The materials necessary are: DI water, rubbing alcohol, graduated cylinders, goggles, aprons, gloves, and lab report material. I have found that this activity is an easy inquiry project. It is easy enough to allow for me to help them ease back into the school year and become familiar with lab procedures. Teaching Notes and Tips One obstacle with this lab is if the student actually gets Should this occur, it is necessary to give the student guidance and assistance as they re-measure their volumes and attempt the lab again. Assessment I have not actually attempted this lab yet. However, it is structured in such a way that there is very little room for error. The lab should serve as an informal way to begin the school year and introduce very basic lab techniques. The student will submit their lab handout with the answers written on that page. However, one could take this a step further and ask the students to create a formal lab report. I have chosen not to do this due to the lack of quantitative data. The student will understand the nature of matter including its forms, properties, and interactions.

Writing a Summary A summary is condensed version of a larger reading. A summary is not a rewrite of the original piece and does not have to be long nor should it be long. Your purpose in writing the summary is to give the basic ideas of the original reading. What was it about and what did the author want to communicate? While reading the original work, take note of what or who is the focus and ask the usual questions that reporters use: Using these questions to examine what you are reading can help you to write the summary. Sometimes, the central idea of the piece is stated in the introduction or first paragraph, and the supporting ideas of this central idea are presented one by one in the following paragraphs. Always read the introductory paragraph thoughtfully and look for a thesis statement. Finding the thesis statement is like finding a key to a locked door. Frequently, however, the thesis, or central idea, is implied or suggested. Thus, you will have to work harder to figure out what the author wants readers to understand. Use any hints that may shed light on the meaning of the piece: In writing the summary, let your reader know the piece that you are summarizing. Identify the title, author and source of the piece. You may want to use this formula: In "Title of the Piece" source and date of piece , author shows that: Here is a sample summary: In the short story "The Secret Life of Walter Mitty," author James Thurber humorously presents a character who fantasizes about himself as a hero enduring incredibly challenging circumstances. In his real life, Walter Mitty lives an ordinary, plain life; he is a husband under the control of an overbearing, critical wife. The story takes place over a period of about twenty minutes; during this brief time, Mitty drives his wife to the hairdresser and runs errands that his wife has given him while he waits for her. In between his worrying that he is not doing what she wants him to do, he daydreams about himself as a great surgeon, brilliant repair technician, expert marksman, and brave military captain. This story shows that fantasy is often a good alternative to reality. Do not rewrite the original piece. Keep your summary short. Refer to the central and main ideas of the original piece. Read with who, what, when, where, why and how questions in mind. Do not put in your opinion of the issue or topic discussed in the original piece. Often, instructors ask students to put their opinions in a paragraph separate from the summary.
