

Chapter 1 : The Prince of Milk by Exurb1a

The Prince of Milk is a leisurely stroll from prehistory to the distant future, stopping for tea in the 21st century English countryside. Before the time machine, before the undead mannequins, before the cat with the universe eye, there were the arbiters.

The villains are all over the top but I liked it. I just might reread this. A solid 5 stars. Mar 09, Geoff Bromilow rated it it was amazing a brilliant little foray into ideas a bit above my pay grade but feels oddly like the point of it all, bringing it back to the characters. It may have had a bit of a slow first act but all together just brilliant May 13, Non C rated it it was amazing [5 stars, 10 stars, ten to the ninety one stars] beautifully strange. Jun 22, Jamie Hart rated it really liked it I read this book about having an existential crisis in a small English countryside town while simultaneously having an existential crisis in a small English countryside town. Mar 12, Ralf rated it liked it Some parts are very clever I love and live for the exurb1a YouTube channel. What can I say about the writing? Whimsical, magical, mind-blowing and strangely reminiscent of Neil Gaiman. I loved the writing. Now onto my qualms. Of which, there were a few. Seriously there were about 10 main characters. I feel like that number could be reduced to six and the story could still be kept the same. I feel like those storylines were really interesting and kept me going through this book. That being said this is definitely a book to recommend. There are some insane twists in this book if you can actually understand what the hell is going on and it takes messing with your mind to a whole new level. While certainly not laid out like a traditional novel, nor is it intended to be so, it still ends up being fascinating if read with an open mind. However, from there onwards, this issue fades in severity, un The Mindstate of a budding author A fascinating book, fill of ideas only someone with an enlightened mindstate such as Exurb1a could come up with. However, from there onwards, this issue fades in severity, until it can no longer be called a problem. The titular prince of milk was mostly just an incompetent ass, which I suppose was the point of him. The writing was good. Good story and not a straightforward one. Interesting characters dialogs and concepts. It gets slower halfway but still good. I guess I can recommend it to those not familiar with Exurb1a.

Chapter 2 : Price of 1 liter (1 qt.) of whole fat milk in Manila :: Expatistan

However, on the Exurb1a discord server we have a channel devoted to politics, if you want to debate/talk about it with the community. The controversy and other drama The current controversy that is going on brings up strong feelings in a lot of people, and leads to a hostile environment.

Messenger A structural change is underway in global dairy markets. A perfect storm has emerged through a coincidence of events, technology, and policy changes across the major dairy producing nations, including Australia, which will result in a long term significant reset of dairy economics across the globe. Cooperatives Murray Goulburn and Fonterra have both dramatically reduced the prices they offer dairy farmers for milk, sparking a backlash from farmers , who say they will be pushed into the red and out of dairy. It is only due to the strength of the two cooperatives in absorbing the costs of high milk prices in a changing market that these reductions did not occur earlier. The cooperatives have shown an inadequate understanding of global dairy economics by over-paying farmers and by seeking to claw back over-paid advances. The low prices have been blamed on a short-term oversupply coinciding with a reduction in demand from China and Russia. Some of this demand is now being met by Chinese investment in both Australia and New Zealand which also contributes to the changes underway. But the debate thus far has focused on problems with demand while ignoring the bigger issue of increasing global over-supply. Since the mids a strong increase in demand for milk products across Asia, largely on the back of rising middle-income wealth led to the complete depletion of surplus dairy stocks in the European Union and the US. To a large extent this imbalance had been driven by regulation of the global supply market in which only a few export nations competed – Australia and New Zealand included. It resulted in higher than historical average dairy prices in global markets, but considerably more short-term volatility due to global GDP shocks and short-term supply-demand imbalances. Regrettably a critical assumption that appears to have emerged among producers during this period, as evidenced by continued investment and expansion, was that the real price for global dairy commodities was increasing, a trend they expected to continue in the long term. The current dairy price scenario, which would historically have been short-lived, is in fact masking underlying structural changes to supply-side dynamics that are now underway. Therefore, a small change in supply globally has a profound effect on the global dairy market equilibrium. The removal of milk production quotas in March presented an opportunity for dairy expansion and, even more importantly, one that is no longer confined to the traditional dairy exporters of Ireland, France, Belgium, and the Netherlands. Under quota, EU exports doubled between and to 9. Quota removal has freed dairy farmers in central and Eastern Europe to increase in scale considerably, availing themselves of technologies denied during the Cold War years. Coupled with the removal of regulations concerning the transportation of liquid milk across borders, producers and processors now find themselves with opportunities for growth not experienced since the second world war. Current dairy production is being stimulated by low feed prices, which were driven by record yield seasons in and , similar levels in and new projected highs this year. Eighty percent of US dairy farm costs are feed. The advent of large-scale fracking, which has resulted in a significant reduction in the price of oil, will likely maintain lower corn prices, at least in the short-term. This comes as the reduced value of biofuels re-focus the use of corn back to a feedstuffs for farmed livestock. Farmers have fought for free trade and open access for decades on both sides of the Tasman. Now that it is emerging, profitable returns will be caught first by the lowest cost global producer. We are fools to think that that will be either Australia or New Zealand. Therefore, possibly with the exception of the US market, a downward reset is in store for global dairy prices.
