*Get this from a library! The indiscernible movement. [Aude; Jill Cairns] -- Winner of the Governor General's Award for fiction in , the work of Quebec writer Aude is now available to English readers for the first time.*

The Houthi rebels have been at war with the Yemeni government almost constantly since . In the first six years, the Houthis fought an increasingly effective guerrilla war in their mountainous home provinces, but after , they metamorphosed into the most powerful military entity in the country, capturing the three largest cities in Yemen. The Houthis quickly fielded advanced weapons they had never before controlled, including many of Iranian origin. The Houthi clan are sadah descendants of the prophet , and their modern patriarch was a respected religious scholar, Badr al-Din al-Huthi, an influential preacher until his death by natural causes in . The Zaydi revival was part social-revolutionary and part sectarian, calling for a reversal of government neglect of rural northern Yemen and limitation on the cultivation of anti-Zaydi salafism in the area. By , the same organization was able to fight the Yemeni government to a standstill in four provinces, seize and hold strategic towns, force entire surrounded brigades into surrender, and carve out tactical footholds inside Saudi Arabian border settlements. The first was to progressively alienate Zaydis. During the fourth war January 27 – June 17, , the Houthis developed the defensive resilience to fortify and defend towns against armored attacks using mines, RPGs, and Molotov cocktails. They also mounted larger storming attacks on government complexes, sometimes in company-sized i. The Houthis also initiated offensive raids into Saudi Arabia, undeterred by an unparalleled level of air surveillance and bombardment. In a first step toward state capture, as one of the anti-government protest factions, the Houthi movement coopted officials within the transitional governing structure, particularly the Ministry of Defense. The Houthi movement also worked with the ousted Ali Abdullah Saleh to position itself for the takeover of the capital, which eventually unfolded as a smoothly executed coup on September 21, . Intercepted by the U. The Ansar Allah War Machine: Though most of these offensives failed to fully dislodge the defenders, the effort was an indication that the Houthi military was a much larger and more capable organization than it had been in . Another factor that supports the sustainment of so many battlefields simultaneously is the very low force-to-space ratio that Ansar Allah employs, in part to mitigate the effects of total enemy air superiority. Fortification and defensive minefields are the cornerstone of this effort. Trench systems continue to evolve, now including zig-zagging lines to limit lateral spread of explosions ; mortar pits with removable camouflage lids; arms caches and communications hubs at key junctions; and solar-powered communication systems. Decoys and smoke canisters are used to complicate air surveillance and targeting. The Houthis are effective at reducing signatures that could betray their location. Emissions control has become good since , with limited use of electronic communications other than low-power Motorola phones. The moving troops will often not have weapons, which complicates the positive identification requirements of air targeting, and will instead link up with cached weapons at the frontline. Their aim, which they have reached with a high amount of success, is to be indistinguishable from civilians. To aid the economy-of-force effort, all defensive positions are covered by chaotically laid harassment minefields and trip wires, and any lost ground will be hastily booby-trapped before evacuation, even civilian homes, farms, and schools. Each fighter might have a one- to three-kilometer front to defend, and will be expected to defend the area successfully or die trying. Houthi fighters use Captagon-type amphetamine-based stimulants to reinforce morale in battle and use female contraceptive pills to aid blood-clotting if wounded. The set-up does not appear to be greatly different in urban defense schemes, with the Houthis preferring to defend locales with long lines of fire rather than manpower-intensive street-by-street defenses. Sometimes a veteran tactical reserve akin to a quick reaction force is kept back with the local area leader. In Aden at the start of the war, weak resistance forces backed by less than 10 UAE Special Forces blunted numerous Houthi battalion-sized assaults aided by pro-Houthi Republic Guard elements with tanks. This last case is a rare example of Ansar Allah using one of its named elite units – in that example, the Katibat al-Mawt Death Brigade – to attempt an operational maneuver. Houthi forces have achieved great tactical success against Saudi border posts through offensive mine-laying on supply routes and ATGM strikes on armored vehicles

and outposts. The clearest example of this is the Burkan 2-H medium-range ballistic missile, which the Houthis have used since May to strike Riyadh and Yanbu, around miles distant from launch points in northern Yemen. In January, the U.S. Wreckage from 10 Burkan missiles suggests that they were smuggled into Yemen in pieces and welded back together by a single engineering team, whose fingerprint non-factory welding technique was found on all the missiles. First, there was no apparent learning curve that would suggest experimental deployment of entirely new rockets and missiles. Since, Ansar Allah has attacked shipping with naval mines and anti-ship missiles that were already in the Yemeni arsenal, to which it has added the use of boat-mounted ATGMs. In Hodeida, a drone workshop operates, drawing on a supply of rolls of fiber-glass to make airframes. The Houthi family has proven to be politically prodigious and very adept at seizing opportunities. It does not feel defeated. The Houthi movement has proven itself to be a very tough military opponent. Fourteen years of conflict has strengthened it, and it thrives under the conditions of war. Iran does not appear to control the Houthi leadership, but it did ramp up its support to the Houthis at precisely the moment that their ambitions broadened not only to control northern Yemen but also to build defensive bulwarks far outside the traditional Zaydi heartland. But Iran has provided critical aid in allowing the Houthis to slow down the Gulf-backed Yemeni government recapture of terrain. The relationship between Iran and the Houthis could remain transactional or it could deepen. He has traveled extensively in Yemen since, including periods embedded with a variety of security forces. The ship has signals intelligence domes and antennae. It is visited by all Iranian ships moving through the Red Sea, nominally to coordinate anti-piracy measures. At least three speedboats are based on deck, which are used to ferry personnel to Yemen. The Houthi troops, largely described as teenagers, were repelled with very heavy use of airpower. The author worked in Yemen previously during the fourth and fifth Houthi wars and gathered some of this data during interviews then, backed up by further interviews of Yemeni commanders on the Nahim front in Author interview, Gulf coalition explosives ordnance technicians. The United Nations confirmed that Iran produced the components used in the Burkan-2H, and these components are not owned by any country other than Iran. The creation of an entirely new extended range version of the Qiam-1, and its smooth operational adoption in Yemen, suggests four to six months of development work in Iran, followed by the training of Yemeni or Iranian assemblers and operators for what was a new weapons system. Author interviews, three weapons inspectors with direct access to multiple Burkan 2H missiles.

*For at first he had lain outstretched on the ground, hidden and indiscernible, like those who lie in wait for swamp-game. We could almost say, not only the same power, but the same sort of power, is indiscernible in Haydn and Mozart.*

Tufekci grounds her analysis on her personal experiences as a participant, participant observer, and ally in several antiauthoritarian uprisings, including the Gezi Park protests in Turkey, the Zapatistas in Mexico, the Tahrir Square protests in Egypt, and the Occupy movement in the US. Her analysis is further informed by on-the-ground interviews with activists and protest participants. Tufekci argues that in order to understand the new movements like the Gezi Park protests of , the Tahrir Square protests of , or the Occupy movement, we have to comprehend the evolving landscape in which political culture and digital technologies interact in complex ways. These new movements may be indiscernible from pre-digital protests like those of the civil rights movements in terms of their visible forms and intermediate outputs e. A key contribution of this book is the development and application of capacities and signals framework to social movements. Tufekci in particular highlights three kinds of social movement capacities that are critical to the exercise of collective power: Seen through the lens of capacity formation, the Tahrir Square protest of had strong narrative and disruptive capacities but had weak electoral capacity, partly due to the political culture that is rooted in institutional distrust. Further, Tufekci suggests that how movements signal their capacities to those in power and how these signals are interpreted matter greatly for movement trajectories. Tufekci traces the power and weaknesses of newer movements to both the political culture and digital technologies. This reconfiguration broadly affects not just online activities, but online, offline, and hybrid instantiations of public spheres and social movement activities. Tufekci approaches social movements as a fight for attention, and conceptualizes censorship as denial of attention through various means. Focusing on shifts in attention as a key analytical construct proves to be fruitful in explaining movement trajectories and tactics, as well as government responses to protests. In the years leading up to the Gezi Park protests, social media provided a means of bringing attention to news that were denied attention in the mainstream media. Participants in Black Lives Matter succeeded in shifting the amount of attention paid to police brutality by tweeting images of police violence. In response, some state actors learned to adjust their tactics for containing the protests over time. In China, the government employs tactics that deny and divert attention, for example, by flooding public spheres with other attention-grabbing news in times of protests. Tufekci discusses how modern networked movements, thanks to social media, can gather momentum and scale up in a matter of few days. In contrast, older movements like the March in Washington in were organized over long periods of time, during which people learned to work together, build trust, and develop capacities for collective decision-making. Such weaknesses are deeply intertwined with the participatory and horizontal culture of modern movements that emphasizes individual expression and eschews formal organizations. The Gezi Park protests, for example, were leaderless by design. Many showed up to the protests representing their own voices and selves, and the point precisely was that they were not being represented by another. When the government of Turkey was ready to negotiate with the people during the Gezi Park protests, the protesters did not have mechanisms to make demands and decisions collectively. This thought-provoking book takes the reader through various social movements with vivid encounters and memorable stories. Tufekci convincingly argues that the defining features of modern networked movements are not merely by-products of technology, but also deeply rooted in the political culture. Key contributions of this book include the many concepts and analytical frameworks the author develops to shed light on longer-term trajectories of networked social movements.

We are currently working on a review of the new version and will also be linking to the Babysense 7 in this review. It is an excellent, high quality, under the mattress movement monitor, with an easy to use one-button interface. Easy setup and a single button to set it and forget it make this monitor stand out from the rest. Babysense eschews bonus features and focuses on simple, reliable function. We love that all of the wires are hidden under the mattress, and the nursery unit is mounted to the exterior of the crib within easy reach when putting baby down for a rest or picking up for a midnight feeding. If you want basic, no-frills function, this is the monitor for you. Our Analysis and Test Results Hisense, the manufacturer of the Babysense 5s released the first version of the monitor in Over 20 years later, the look of the monitor has changed but the proven technology remains unchanged. Winner of our Top Pick for Simplicity and Ease of Use, it functions in the same manner as the Angelcare AC with an under-the-mattress sensor pad detecting movement. This unit is somewhat unique in the movement monitor marketplace, as it is a medically approved device in the European Union, Israel, Japan, Korea, and Australia. It is not, however, a medically approved device in United States. In order to achieve medical certification in the countries that it has, the 5s has had to undergo clinical trials. In a recent clinical trial that took place in Israel, the Babysense 5s was shown to be effective in detecting both apnea, and bradycardia with similar accuracy to an electrode based hospital monitor. See the link below for more information on the clinical trial. The Angelcare AC is more customizable and feature packed, but it is more difficult to use and less portable. If you are looking for simplicity and reliability, the 5s could be right for you. Performance Comparison Reliability This monitor proved to be a reliable unit during testing. It scored slightly lower than the Angelcare AC, because it only has one power source. During testing, we found that a floor vent close to the crib would create enough external vibration when the heater was on to activate the sensor and prevent it from alarming. After performing tests outlined in the user manual, we turned the sensitivity down on the sensor pad but were still getting interference. We had the same experience with the Angelcare AC, but were able to tune the sensor to prevent interference. After moving the crib over 2 feet we were able to eliminate interference with the sensor set on the most sensitive setting. The 5s comes with two sensor pads, and the manufacturer recommends the use of 1 pad until the infant can roll over and move, and then adding on the second sensor. The loud audio alarm sounds when no movement is detected for 20 seconds, or movements are less than 10 per minute. We had no false alarms in either configuration once set up correctly. Ease of Use Here we have the parent unit. The white button in the middle turns the unit on and off. This is where the 5s truly shines. Set up is easy in either the one or two sensor configuration. Just like the Angelcare AC, a rigid surface is required for the sensor pad to work correctly, this may require you to cut a piece of plywood or masonite to fit your crib. The nursery unit is mounted to the exterior of the crib using the included bracket that relies on the weight of the mattress and the slats on the crib to hold it in place. All wires are concealed and out of reach under the mattress. Four AA batteries power the unit; battery life was excellent, lasting nearly 3 months of daily use for both nighttime sleeping and naps. When the batteries get low, a low battery indicator light illuminates on the nursery unit. There is only one button on the nursery unit, used to turn it on and off. This is the most simple operation of any monitor we tested. When you turn the unit on, a blue light begins flashing indicating movement is being detected, and a red light will begin flashing with the audio alarm in the case that movement is not detected. We like the fact that the nursery unit is mounted to the exterior of the crib, which keeps it within easy reach when you are putting baby to bed or getting them out of the crib. Portability The nursery unit mounts to the exterior of the crib for easy access. With less cords and components than the Angelcare AC, it is easier to pack up and take on the road. The hard surface requirement for the sensor pads limits its use in travel cribs and hotel cribs, so if you plan to use it on the road, you will need to check your travel crib for compatibility. Babysense states that it can be used in travel cribs if the bottom is rigid enough to provide a stable platform. In practice, we did not have much luck using it in the

travel cribs at our disposal, due to wire routing issues and non-rigid platforms. Despite these drawbacks, it is still much easier to move around and set up than the Angelcare AC, so if your child spends a significant time with family or caregivers, or has a crib in another location, it is still a good option. Best Application This monitor is best suited to stationary use in your home crib. It is however reasonably easy move, so it can be a good option if your baby moves between cribs at different locations. Please note, it does NOT have a parent unit, so it is a good option for those who already have a sound monitor, or video monitor and wish to add a bit more peace of mind with a monitor that also detects movement. Value The 5s is an excellent, high quality monitor with a price to match. You are paying more for this monitor due to its medical device certification not certified in the USA and the research and clinical trials that go along with it. It is possible that the internal components are of higher quality than Angelcare AC, but it is impossible for us to make that determination based on our testing. In practice, the movement detecting function of the two units was indiscernible. So in short, the Angelcare AC is a better value. Conclusion This monitor is a great choice for those wanting a simple monitor that will get the job done. With excellent reliability, high quality and top scores for ease of use, it is a good choice for those that do not need the sound and temperature monitoring features of the Angelcare AC

*indiscernible* â€¢ *The crack in the windshield was almost indiscernible.* â€¢ *Her nod was indiscernible, with no appeal as to what and whom Ezra wanted to talk about.*

A majority of rattlesnake bites happen, not by accident, but because the snake was not allowed to escape, but rather was wrangled by a shovel or stick, sniffed at by a big wet nose, or swiped at by a fur clad paw. A majority of rattlesnake bite victims survive, whether it be a dog, cat, or human, because they seek immediate medical attention. Most dogs are usually bitten on the nose and face because they want to sniff the snake, while cats are bitten on the paw because they want to swat at the snake. A bite is particularly serious if the dog or cat has been bitten in the eye, mouth, or ear area because of the concentration of blood vessels. Being bitten in the chest is also very serious because of the proximity to the heart and other vital organs. Rattlesnakes have a distinctive triangular shape to their head with a noticeable neck. They also have vertical pupils, whereas non-poisonous snakes have round pupils and a more streamline design between their head and body. Snakes will strike again and again, which will make the situation worse if the snake is indeed poisonous. When in doubt, seek medical attention quickly. If the bite was from a poisonous snake, swelling will be fast and considerable. Remove anything from your animal that is close to the bite that will restrict circulation, like a collar or bandana. This includes rings, bracelets, watches, clothing, and shoes for humans. Rattlesnakes can strike so fast that their movement is indiscernible to the human eye. A rattlesnake does not have to be coiled to strike. They can strike in any position, but if given enough of a warning they will coil, because this posture gives them the best striking distance. Often rattlesnakes strike first and rattle after, so do not rely on hearing them. Rattlesnakes are deaf, so if you hike, carry a stick and use it to announce your path by tapping it on the ground and poking it ahead of you in overgrown areas. Rattlesnakes are sensitive to vibrations and will get out of your way if you give them enough warning. Get everyone away from the snake. It is difficult to identify a snake unless you are an expert. It is not necessary to know what kind of rattlesnake caused the bite. Get medical help immediately. Animals with the highest mortality rate are small breed dogs and dogs who did not get medical attention right away. Call your vet en route, so the staff is prepared for you. Cats survive bites surprising well with immediate medical attention. Keep the pet calm. If possible, carry the animal. The more activity, the more blood circulation, the faster the toxin will spread through the body. Despite your reflex to treat the swelling, ice will aggravate the problem. Twenty-five percent of rattlesnake bites are dry, meaning they release no venom, but it is still prudent to seek medical attention. Do not consider baby rattlesnakes less of a threat. Baby rattlesnakes can release more venom than an adult because controlling the amount of venom they release is a skill they develop over time. Your veterinarian may want to give your dog or cat Antivenin. It is very important to tell your veterinarian if your dog has received Antivenin before. A second dose of Antivenin carries a higher mortality rate than the snake bite. Antivenin is expensive and should be used in the most severe cases. Your pet will be put on intravenous fluids and perhaps anti-histamines. The best plan is to avoid snake bites all together by giving any snake the right of way. Keep your dog by your side when hiking and carry a staff for announcing your path ahead of you. In fact, some hard headed dogs get bit several times a season because they just cannot learn to leave the snake alone. There is a vaccination against rattlesnake bites, but its use is limited because it is so new. Do not assume that no rattlesnakes live in your area, habitats change because of land development and fluctuations in rodent populations. Be aware and be safe; rattlesnakes are coming out of hibernation right now.

I have heard it said that to understand women, it is better to spend ten years with the same woman, than to spend ten years with a different woman each night. So it is with collecting fine watches. A collector can own hundreds of watches over a lifetime, and not understand horology as well as he or she will by owning one watch as magnificent as this This particular watch is in a class of its own, even in the Patek world. Case is polished 18k rose gold with dimensions of 36mm diameter by 12mm thick. Sapphire crystals front and back. Condition is indiscernible from new, with perfect uncompromised steps on the lugs. Importantly, JPH did not make all cases, only a handful of them. The reference is the last minute repeater watch with JPH cases. Please refer to the picture below of the hallmark on the lug. Philippe Stern believes that rose gold produces the best repeater tone due to the porosity of the copper alloys. Stern reserved the rose gold minute repeaters for his best customers. Patek customers likewise consider the rose gold repeaters to have the best tone and consider them the most desirable repeaters. Dial is solid gold, with silvered color, and applied rose gold stick markers and dauphine hands. Movement also features 39 jewels, self-compensating free-sprung balance adjusted to heat, cold, isochronism and in 5 positions, and stamped with the Geneva Seal. The caliber also features a 22k micro rotor with hand guilloche. Movement is constructed from individual parts. Watch is indiscernible from new and will be delivered with second case back also bearing the JPH hallmark , setting stylus, box and papers.
