Chapter 1 : Pocket Guide for International Dietetics and Nutrition Terminology (IDNT - Ada - Google Books

International Dietetics and Nutritional Terminology (Idnt) Reference Manual: Standard Language for the Nutrition Care Process (THIS IS THE OLD EDITION).

Deanna Zidar on June 18, at 2: It was designed to support the development of nutrition templates within electronic medical records and to provide consistency of documentation and communication both within the profession and between professions. IDNT is now being implemented in various hospitals across Canada and allows Registered Dietitians to make appropriate diagnoses for their patients, while providing consistent documentation and language within the health record. Diagnoses are classified within four different domains: Intake, Clinical, Behavioural-Environmental, and Other. Within these domains are various diagnoses. These diagnoses are then related to an etiology and evidenced by the signs and symptoms the patient is experiencing. The following is an example of a nutrition diagnosis statement: One such area where these diagnostic terms seem appropriate is patient intake. Patients have limited or inadequate oral intake in the hospital setting for a multitude of reasons, including side effects from medications, disease states, or level of consciousness. But patients can also experience inadequate intake due to food quality and food service. Typically, clinicians will relate these diagnoses to clinical states, such as a catabolic illness increasing nutrient needs or a decreased ability to consume adequate energy. However, the cause for this diagnosis can be as simple as the patient finding the food or meal service unappealing and unappetizing. That is not to say that all hospital food has to be that way! While this definition may seem quite complicated, at its root is the cornerstone of all foodservice practices: The diagnostic statements can also be used to determine if the menu or specific diet provided to the patient is appropriate. Certainly most, if not all, hospitals would have considered these factors prior to implementing a new diet, but with the nutrition world ever changing, these diagnostic statements can assist hospital foodservice operations to remain in the loop with current nutrition research. IDNT is still in its infancy. The diagnostic terms are even coded to allow for evaluation of dietetic practice and for research purposes. With this coding, IDNT provides yet another platform to evaluate patient satisfaction and appropriateness of menus and therefore improve food quality and foodservice within the hospital setting.

Chapter 2 : Dietitians in the Health Care System - Dietitians of Canada

International dietetics and nutrition terminology (IDNT) reference manual: standardized language for the nutrition care process RMI58 Issues and choices in clinical nutrition practice.

This guideline addresses topics that correspond to the following areas of the Nutrition Care Process. Standardized Language for the Nutrition Care Process. Nomenclature The terms "adolescent" and "teen" are used interchangeably throughout this guideline to describe the pediatric population aged 12 to 18. Based on the assumption that all behavior is learned and is directly related to internal factors i. Application involves use of both cognitive and behavioral change strategies to affect behavior change. Treatment approaches characterized by multicomponent intervention that interact in non-linear ways and which are highly contextually dependent i. When different components of an intervention are functionally interchangeable or have the same net effect if substituted for each other in treatment management. Factors or elements outside the direct content of the intervention that may influence study outcomes i. When the effect of an intervention component depends on some feature or combination of features of the context of the intervention. Involve a group discussion between a health professional RDN or behavioral health counselor, or exercise physiologist, etc. Involve a one-on-one discussion between a health professional e. Study arms characterized by interventions that tend to include all of the following major components: Minimal intervention type MI: Study arms characterized by interventions that are likely to be missing at least one of the above major intervention components. A strategy for therapy within a particular program component or mode of treatment. A particular configuration of intervention components. Medical nutrition therapy MNT: An evidence based application of the Nutrition Care Process. A combination of different modes of treatment which may include medical nutrition therapy, physical activity, and behavior therapy. Depending on the expertise and training of the health care team members, different treatment components may be delivered by one or more persons. The combination of two intervention components that may counteract the individual effects of each individual component. The combination of components may have no effect or could have an adverse effect. A combination of two or more intervention components that produce a total effect greater than the sum of the individual components. The combined effect may either a positive or negative impact on the outcome. Combined children and adolescent populations.
