

Chapter 1 : PHP Store Inventory Management System

In our project "STORES MANAGEMENT SYSTEM " we have automated the stores of the central power distribution company limited. In Issues module, we have tracked the information regarding the issues of the receipts for the material that have been stored in the stores of the central power distribution company limited at CPDCL.

The quantity purchased is entered in the stock. As the shoes are purchased from the shoe store, the stocks will keep on decreasing. Initially the name of the shoe store shop is saved in the database. When a customer enters the shop and purchases the shoe, the bill will be generated in the billing counter. The name of the customer is noted down to inform them about any kind of discount available in the store on different occasions. The message will be sent to the customers respective email id or mobile. The bill counter man is supposed to enter the type of the shoe purchased, quantity. The rate of each shoe is directly fetched from the system as the rate will be saved in the master by the admin. No end user has the right to edit the rates other than the Admin. Admin has high authority over the system. After entering the necessary details, total rate will be automatically calculated. This is reduces the paper consumption and manpower calculation. After entering the user must click on save. The record will be saved in the database. To print the bill, the end user must click on print button. If the printer is connected to the system, the bill will be automatically printed. The printed bill consists of the name of the shoe store shop name which is fetched from the database as well as the date and time of billing, shoe name, quantity, rate and total amount. After customer pays the amount, the end user must select the record and click on paid. The record will directly move to the paid tab. The paid tab consists of all the sales and bill paid on purchase of shoe. The report can be generated at the end of each month or at the end of each year. Sample code is provided in the below link. Chapter 2 : Bookstore Management System | Gail Carmichael

Store Management System is advanced level project which will be used for overcoming challenges faced now days for running store using store management system. This System provides advanced level analytics or data to take decisions and increase business to next level to get more revenue for the store.

Add new item in the database. Firstly gets the input of Category, Type, Name, Artist, Price, Quantity from the database stringstream function can copy the non-string variable to a string variable. Function ShowAllItems Shows all the item in the database. Assign result in qstate Finally show the result in the console of all rows in the database Lastly, Exit Code run for go to main function or exit. Lastly, Exit Code run for go to main function or exit. Function FindMusic Find items from database Four ways to find items Name, Type, Artist, Category From the choose of one item from the list the user can search that particular item The program is smart so if the user type one word then it can find the result with that word. Finally the Exit Code terminates the program or go to main function or repeat the same function. Function EditItem User can edit any item. Firstly all the items name and ids are displayed in the console. Than the user can choose only one item and can edit the item. The user can change the item property or remain the item property same. Function RemoveItem Firstly shows all the items Name and Id in the database with mysql query Then it check the number is valid or not if not than show a message If the number is valid than the program execute the mysql delete query and delete that item from the database and show a message. Function CreateOrder User can create an order. Firstly the mysql query select all the items from the database and display in the console if the item quantity is more than zero. It also store the items in an array. Now the user can type the ID of the song. The user can type same id of the song. It also checks the id validity. Now the program shows the list of the items After that the program can edit the list item by removing items from the list or buy the items. When the program goes to buy function then two loops are execute. Then a mysql query is get the current quantity of the item in the database. Then the quantity calculation, in every purchase the quantity reduce of the respective item. The update mysql query update the last calculated item quantity in the database. Finally the result message and the total price pops up in the console. Then the Exit Code executes. Function SoldItems The sold item shows the item all the items that sold and how many of them are sold with its all property. Then the Exit Code runs.

Chapter 3 : Best Project Management Software and Tools | Reviews of the Most Popular Systems

Stores Management System is a web based manufacturing system that enables a manufacturing industry to schedule its manufacturing operations based on the daily update of sales from its dealers.

The entity-relationship diagram of Store Management System shows all the visual instrument of database tables and the relations between Product, Bill, Stock, Store etc. It used structure data and to define the relationships between structured data groups of Store Management System functionalities. Store Management System entities and their attributes: The details of Stock is store into the Stock tables respective with all tables Each entity Store, Product Quality, Customer, Product, Stock contains primary key and unique keys. The entity Product Quality, Customer has binded with Stock, Product entities with foreign key There is one-to-one and one-to-many relationships available between Customer, Bill, Store, Stock All the entities Stock, Customer, Product Quality, Store are normalized and reduce duplicacy of records We have implemented indexing on each tables of Store Management System tables for fast query execution. We provide full Python Web Application Projects with source code. Here students can search easy python projects and get easily download We can develop simple php mysql project for students who want to use php online projects to learn. The main aim of this project is to manage all We provide full php online projects for students. The main aim of the java software projects is to develop web application in college submission. Easy java projects are available in our website Freeprojectz. We can develop best java software projects code for students who want to use java projects for learning. The main objective for developing this project was to sell We provides many types of java software projects to be developed as the final year college project for students. The main objective for developing this Online Shoe Shopping System project was to sell the shoes of different brands online. This project provides a lot of features We are providing php online projects with source code for student purpose. An online shopping project in php with database which will allow formal and informal merchants Here we are providing best php projects free download with source code, database and documentation. An Online Fashion Store which will allow formal and informal merchants The main aim of the php mini projects with documentation is to develop web application in college submission. An Online Mobile Store which will allow formal and informal

Chapter 4 : Music Store Management System/Project C++ Program with MySQL database | Code with C

The Stores Management System is targeted to automate the almost all of the processes mentioned above to reduce the clerical labor of the staff working in Stores both technical and as well as Accounts departments using the software Industry's latest technologies and cost effective tools there by providing the better control to the management by avoiding manual errors etc.

Chapter 5 : Store Management System ER Diagram | FreeProjectz

Lines Of Code (LOC): The source code of this "Store Management System in C++" is about lines. Also, it is password protected. The password to enter this system is "projectnotes" (all with lower case).

Chapter 6 : BOOK STORE MANAGEMENT SYSTEM by shubham bhumkar on Prezi

BookStore Management System is the web application to automate all kinds of operations in the book shop. This project which maintains records of sales, purchase and staff records.

Chapter 7 : Stores Management System - Free Student Projects

This mini project is the sample project for managing book store. Project system that offers many flexible and convenient

feature. Only basic knowledge of computers is required for operation. Consist of all information of books and books sold to the customer. Improved customer service through greater.

Chapter 8 : Store Management System Project in Java - ProjectsGeek

As the name suggests, the Mobile Store Management System application which deals with maintaining the inventory and the billing process with great ease. The owners of the mobile shop can solely depend on this application.

Chapter 9 : ERP Cloud Software | AI ERP Cloud Products for Enterprise | Infor

Music Library Management System have to manage various musical items comes with number of models and variety. Maintaining all musical records such as create order, calculate bill, add new music in database, edit the music description, and delete any item from large music library was not an easy task on regular basis.
