This model can be used in a survey to see where a company stands regarding maturity and once this maturity is understood, it can provide the organisation with a roadmap that identifies opportunities for enhancing the harmonious relationship of business and IT [Luftman,]. The model consists of 6 alignment areas. Each area has multiple attributes. For each area there are clearly defined maturity levels. All areas should be given attention to mature the alignment between business and IT. With the help of a questionnaire, based on the SAMM elements, people from business and IT valued each question with a score between 1 and 5. These scores correspond with the maturity levels as defined by Luftman. One question per attribute of the model. The outcomes of the survey can be plotted in a graph. What does help, is using the outcomes to start an open dialogue with and between business and IT representatives. By looking at the outcomes, one can easily point at situations where business and IT disagree, or where the mean score is low. Luftman states that all elements of the model should be more or less on the same level to have good alignment. Such a survey facilitates an open discussion. And, in this discussion you can find out why people valued certain elements the way they did. And this provides valuable insight into which areas improvements are possible and needed. In some cases, the questionnaire was send to different levels of the organisation. On strategic, tactical and operational levels. This was useful as well, because this gives insight in differences between these levels. From a practical perspective, this survey is easy to apply. These scores enable the dialogue between business and IT.
