Falko Timme, Himanshu Arora In this tutorial, we will show you how to edit files on the command line. This article covers three command line editors, vi or vim , nano, and emacs. Please note that the file is created if it does not exist yet. The most important commands in vi are these: Press i to enter the Insert mode. Now you can type in your text. To leave the Insert mode press ESC. To delete the character that is currently under the cursor you must press x and you must not be in Insert mode because if you are you will insert the character x instead of deleting the character under the cursor. So if you have just opened the file with vi, you can immediately use x to delete characters. If you are in Insert mode you have to leave it first with ESC. If you have made changes and want to save the file, press: If you are, press ESC to leave it. If you have made changes, but want to leave the file without saving the changes, press: So that was all about the vi editor. You can also launch the editor directly with a file. The highlighted line below the edit area shows important messages, and the last two lines are really helpful for beginners as they show keyboard shortcuts that you use to perform basic tasks in nano. Note that at this stage, you also have an option to save in different OS formats. Press enter and your changes will be saved. Now comes search operations. If not already, you can install the editor on your system using the following command: Like nano, the emacs UI is also divided into several parts. The editor will confirm this through a prompt - see screenshot below: However, there are shortcuts that make your deleting experience smooth. Then the editor will ask you for the replacement. Well, those can be accessed using the F10 key. To come out of these menus, press the Esc key three times.
