Extra resources for Psychiatry in the Elderly Example text All currently available data thus point to the inheritance of longevity as determined by variable numbers of interacting genes, whose expression is subject to major modification by environmental agents. Support for this interpretation comes from data on the human leucocyte antigen HLA system which showed a significant excess of specific HLA antigens among nonagenarians, Cw7 in males and Cw1 in females, suggesting the association of certain haplotypes with increased survival Proust et al. Therefore, unless an extremely low functional threshold is operational, respiration should be adversely affected only to a limited extent. As previously discussed, the role of the nuclear genome in mtDNA mutations may prove to be critical. An indication of the significance and complexity of this interactive role was demonstrated in progressive external ophthalmoplegia PEO. Bittles in cultured human diploid fibroblasts from normal individuals and from a person with Hutchinsonâ€™Gilford progeria overlapped to a large degree Ly et al. Experimental methods for the modification of rates of ageing By definition, if ageing is mainly stochastic in nature then it should be possible to retard development of the ageing phenotype by altering the relative influence of contributory environmental variables. Although many theories have been proposed and experimentally tested, the only method so far proven to increase maximum lifespan in mammals is calorie restriction, the feeding of a diet low in calories but otherwise nutritionally adequate.
