A and allowed us to get there. I saw one of the police ofheroes. But the rhinoceros carcasses kept piling up around them, and it was only after dozens of these hulking, relatively rare animals were dead and their precious horns sawed off that an extravagant scheme came to light. The Thai women, it ends up, were not hunters at all. Many never even squeezed off a shot. Instead, they were prostitutes hired by a criminal syndicatebased 6, miles away in Laos to exploit loopholes in big game hunting rules and get its hands on as many rhino horns as possible â€” horns

that are now literally worth more than gold. Driven by a common belief in Asia that ground-up rhino horns can cure cancer and other ills, the trade has also been embraced by criminal syndicates that normally traffic in drugs and guns. They have branched into the underground animal parts business because it is seen as "low risk, high profit," U. T he n u m b e r o f r h i n o s poached in South Africa has soared in the past five years, from 13 killed in to more "Get caught smuggling a than thisyear. The prehiskilo of cocaine, you will re- toric, battleship-gray animals ceive a very significant prison are often found on their knees, sentence," said Ed Grace, a bleeding to death from a gapdeputy chief with the U. Fish ing stump on their face. But with a kilogram of rhino horn, he said Philip Jonker, who works added, "you may only get a for a private security firm that ing on safari. Rhino horns regenerate, and the horns can be shaved down every few years and tQ sold off without significantly hurting the animal. But many wildlife groups say legalizing the rhino trade would be a disaster.

## Chapter 2 : About Your Privacy on this Site

*After each treatment, checking the hair and combing with a nit comb to remove nits and lice every days may decrease the chance of self-reinfestation. Continue to check for weeks to be sure all lice and nits are gone.*

Which medicine is best? Is mayonnaise effective for treating head lice? CDC does not have clear scientific evidence to determine if suffocation of head lice with mayonnaise, olive oil, margarine, butter, or similar substances is an effective form of treatment. The following are several common reasons why treatment for head lice may fail sometimes: The symptoms are not caused by an active head lice infestation. Applying the treatment to hair that has been washed with conditioning shampoo or rinsed with hair conditioner. Conditioners can act as a barrier that keeps the head lice medicine from adhering to the hair shafts; this can reduce the effectiveness of the treatment. Not following carefully the instructions for the treatment that is used. Some examples of this include not applying a second treatment if instructed to do so, or retreating too soon after the first treatment before all the nits are hatched and the newly hatched head lice can be killed. Another reason is retreating too late after new eggs have already been deposited. Resistance of the head lice to the treatment used. The head lice may have become resistant to the treatment. If the treatment used does not kill the head lice, your health care provider and pharmacist can help you be sure the treatment was used correctly and may recommend a completely different product if they think the head lice are resistant to the first treatment. The person was treated successfully and the lice were eliminated, but then the person becomes infested again by lice spread from another infested person. Sometimes reshampooing the hair too soon less than 2 days after correctly applying and removing permethin can reduce or eliminate any residual continued killing effect on the lice. Back To Top Is there a treatment recommendation for certain age groups? Are there any side effects from using these chemical treatments for head lice? Treatments for head lice are generally safe and effective when used correctly. Some treatments may cause an itching or a mild burning sensation caused by inflammation of the skin on the scalp. Most products used to treat head lice are pesticides that can be absorbed through the skin. Therefore, all medicines used for the treatment of lice should be used with care and only as directed. Is it necessary to remove all the nits? The two treatments 9 days apart are designed to eliminate all live lice, and any lice that may hatch from eggs that were laid after the first treatment. Such nits are usually not viable and very unlikely to hatch to become crawling lice, or may in fact be empty shells, also known as casings. Nits are cemented to hair shafts and are very unlikely to be transferred successfully to other people. However, parents may choose to remove all nits found on hair for aesthetic reasons or to reduce the chance of unnecessary retreatment. Back To Top Where can I go to have the nits removed from hair? CDC does not make recommendations about businesses that may offer such services. Your health care provider or local health department may be able to provide additional guidance. Removal of all nits after successful treatment with a pediculicide is not necessary to prevent further spread of head lice. Removal of nits after treatment with a pediculicide may be done for aesthetic reasons, or to reduce diagnostic confusion and the chance of unnecessary retreatment. Why do some experts recommend bagging items for 2 weeks? Head lice survive less than one or two days if they fall off the scalp and cannot feed. Head lice eggs nits cannot hatch and usually die within a week if they do not remain under ideal conditions of heat and humidity similar to those found close to the human scalp. Therefore, because a nit must incubate under conditions equivalent to those found near the human scalp, it is very unlikely to hatch away from the head. In addition, if the egg were to hatch, the newly emerged nymph would die within several hours if it did not feed on human blood. However, although rarely necessary, some experts recommend that items that may be contaminated by an infested person and that cannot be laundered or dry-cleaned should be sealed in plastic bag and stored for 2 weeks to kill any lice that already are present or that might hatch from any nits that may be present on the items. Should my pets be treated for head lice? Head lice do not live on pets. Pets do not play a role in the spread of head lice. Back To Top Should household sprays be used to kill adult lice? Using fumigant sprays or fogs is NOT recommended. Fumigant sprays and fogs can be toxic if inhaled or absorbed through the skin and they are not necessary to control head lice. Do I need to have my home fumigated? Use of insecticide sprays

or fogs is NOT recommended. Fumigant spray and fogs can be toxic if inhaled or absorbed through the skin and they are not necessary to control head lice. Routine house cleaning, including vacuuming of carpeting, rugs, furniture, car seats, and other fabric covered items, as well as laundering of linens and clothing worn or used by the infested person is sufficient. Only items that have been in contact with the head of the infested person in the 48 hours before treatment need be considered for cleaning. Should I have a pest control company spray my house? Routine vacuuming of floors and furniture is sufficient to remove lice or nits that may have fallen off the head of an infested person. Will laundering kill head lice? Dry cleaning also kills head lice and nits. Only items that have been in contact with the head of the infested person in the 48 hours before treatment should be considered for cleaning. Although freezing temperatures can kill head lice and nits, several days may be necessary depending on temperature and humidity; freezing is rarely if ever needed as a means for treating head lice. CDC does not make recommendations about specific products. When using a medicine, always carefully follow the instructions contained in the package or written on the label, unless the physician and pharmacist direct otherwise.

**Chapter 3 : Home cleaning instructions for head lice**

*Proper home cleaning during a lice infestation is very important. It is possible for head lice to live temporarily on items such as bedding, couches, hair accessories, car seats, toys and clothing.*

Posted on November 12, Many are concerned about cleaning hair brushes during a lice outbreak. Regular cleaning will help hair styling tools last a lot longer. During a lice outbreak be sure to dispose of the tresses in the outside garbage. Many people like to use the dishwasher on a high heat dry for cleaning brushes! This might damage some of the handles, but we know in a case of a lice infestation combs are thrown out multiple times and most Moms prefer to throw them away and get new ones! For items that cannot be soaked in hot water place them in a tightly sealed plastic bag and put them in a freezer for hours to kill the lice and eggs and then presume with ordinary cleaning of your hair brushes. For Ordinary Hairbrush Cleaning: Gather you hair brushes and combs and wet the bristles not the bodies of the tolss under warm water then place a small dab of shampoo onto the bristles or comb and carefully rub the bristles together for two combs or gently for a comb brush combination. Run under water rubbing gently until all the suds are gone. Dry the brush or comb on a towel. If there is still leftover grime on hair styling tools, use a cotton swab to get any left over product from in between bristles and repeat the process above. Then, soak hairbrushes and combs in the bathroom sink with about one half cup of baking soda and warm water for about fifteen minutes. The final step is to let the hair-styling tools air dry on towel. Remember not to immerse certain types of brushes or combs in the water. These types are the following: Rubber- cushioned brush Wooden bodied brushes or combs Natural boar bristle brushes. Permitting water to get through the vent hole on cushioned brushes will erode the cushioning of the brush. A wooden bodied brush or comb may cause wood to absorb water and damage the finish or make the body swell and break. Natural boar bristle brushes contain natural hair that would take in moisture as would other types of natural hair. The bristles on boar bristle brushes would twist or curl if dampened. Squirt of Dawn Dish Soap or other dish-washing liquid Sink of warm water 1. Begin by filling your sink about a quarter full with warm water. Particularly for the hair brushes, remove as much of the hair that may be stuck in them as possible before adding them to the water. Place the combs and hair brushes in the soapy borax water and let them soak for a while. About 30 to 45 minutes should do it. After that time has passed, you should find that your combs and brushes are clean again and that all the product build up is gone. Rinse the combs and brushes with clean warm water and then dry them off.

*Head lice removal combing takes the right products, patience, and a lot of practice. In this video, the lice experts at Lice Control give you all you need to know about effective head lice combing.*

Helping Nebraskans enhance their lives through research-based education. Look for signs of head lice by examining all areas of the scalp. Adult and immature lice look similar. They cannot fly or hop, but crawl quickly. Lice eggs nits are white when first laid. The nits turn coffee-colored Figure 2 before they hatch. This glue is so strong the nits cannot be as easily removed as dandruff and other hair debris. Check Every Family Member: Lice are hard to see, so look for tiny, brownish eggs on the hair near the scalp, especially at the nape of the neck and behind the ears Figure 3. Hatched eggs will be white. Check everyone for lice at least once a week. Use a Product to Treat Lice: Several products are available without a prescription or talk to your doctor about treatment for head lice. Combing is essential to removing those lice not killed by lice products. What about mayonnaise, olive oil or vaseline? Studies have shown lice can survive after an overnight treatment of mayonnaise, olive oil or Vaseline. Lice are so small they are easy to overlook. If you missed just a few tiny lice or eggs, the infestation will start over again. But, if you have time, wash bedding, towels and recently worn clothing when you treat your family member. Use hot, soapy water in a washing machine. Drying in a degree F dryer will kill lice and nits. Vacuuming--Vacuum carpets, pillows, mattresses and overstuffed furniture. Vacuum the car seats. It is recommended you vacuum these items instead of using insecticidal sprays. Items such as stuffed animals and pillows which are not washable can be stored in tightly sealed plastic bags for two weeks. Lice and their eggs will be killed if they freeze so some items can be placed in a freezer overnight. Combs and Brushes--Family combs and brushes should be soaked for 15 minutes in very hot water. Tell your child not to share these items with others. Focus your control efforts on combing to eliminate lice. When combing, hold the mass of hair with one hand. With the other hand, hold the lice comb in a slanting position with the teeth toward the head. Getting ready--You Will Need: A metal comb is less flexible than plastic ones and may be more effective at removing nits. Combing should be done in a well-lighted area. It might be a good idea to have something fun to entertain the child that does not require much physical activity. Preparing the hair--Cover the hair with any type of salad oil or conditioner to keep the hair wet so combing is easier. Remove tangles with a regular hair comb. Combing--Separate a mass of hair about the width of the metal lice comb. It is important to separate the hair into small sections so you can more easily see lice and nits. Hold the mass of hair with one hand. Insert the lice comb as close to the scalp as possible and gently pull the comb slowly through the hair several times. Check the hair carefully. Comb one section at a time and check each section again Figure 4. Pin the hair in a curl flat against the head. Dip the comb in the soapy water and use the tissue to remove lice and debris. Make sure the comb is clean before you use it on the hair again. Cleaning Up--Flush the contents of the bowl down the toilet. Shampoo the hair at least twice to remove the oil. When the hair is dry, check for stray nits and remove those hairs individually with a pair of small, pointed scissors. It is VERY important to remove all of the eggs nits. Soak the lice comb for 15 minutes in hot ammonia water 1 tsp ammonia to 2 cups hot water. Or, boil the metal comb in plain water for 15 minutes. Use an old toothbrush to clean the comb. The comb can now be used on another family member. The video features highly-magnified live lice, a combing demonstration on a child and actions to help prevent re-infestations. These videos are available in English, Spanish, Arabic and Russian languages. Ordering "Removing Head Lice Safely": Brochure and Details "Managing Head Lice Safely," an educational resource guide which provides detailed information on head lice control. Adult Head lice and Nit. Nit Attached to Hair Shaft. It may or may not apply in your area.

*Avoid lice sprays! Vacuuming is the safest and best way to remove lice or fallen hairs with attached nits from upholstered furniture, rugs, stuffed animals and car seats. Notify your child's school, camp, child care provider, neighborhood parents, or [click here to report a lice outbreak to the NPA](#).*

Each Over-the-counter product approved by the FDA for the treatment of head lice contains one of the following active ingredients. If crawling lice are still seen after a full course of treatment contact your health care provider. Pyrethrins combined with piperonyl butoxide; Brand name products: Pyrethrins are naturally occurring pyrethroid extracts from the chrysanthemum flower. Pyrethrins are safe and effective when used as directed. Pyrethrins can only kill live lice, not unhatched eggs nits. A second treatment is recommended 9 to 10 days after the first treatment to kill any newly hatched lice before they can produce new eggs. Pyrethrins generally should not be used by persons who are allergic to chrysanthemums or ragweed. Pyrethrin is approved for use on children 2 years of age and older. Permethrin is a synthetic pyrethroid similar to naturally occurring pyrethrins. Permethrin is safe and effective when used as directed. Permethrin kills live lice but not unhatched eggs. Permethrin may continue to kill newly hatched lice for several days after treatment. A second treatment often is necessary on day 9 to kill any newly hatched lice before they can produce new eggs. Permethrin is approved for use on children 2 months of age and older. Back to Top Prescription Medications The following medications, in alphabetical order, approved by the U. If crawling lice are still seen after a full course of treatment, contact your health care provider. It kills lice but it is not ovicidal. A second treatment is needed 7 days after the first treatment to kill any newly hatched lice before they can produce new eggs. Benzyl alcohol lotion is intended for use on persons who are 6 months of age and older and its safety in persons aged more 60 years has not been established. It can be irritating to the skin. It is not ovicidal, but appears to prevent nymphs newly hatched lice from surviving. It is effective in most patients when given as a single application on dry hair without nit combing. It should not be used for retreatment without talking to a healthcare provider. Given as a tablet in mass drug administrations, oral ivermectin has been used extensively and safely for over two decades in many countries to treat filarial worm infections. It should not be used in children weighing less than 15 kg or in pregnant women. The formulation of malathion approved in the United States for the treatment of head lice is a lotion that is safe and effective when used as directed. Malathion is pediculicidal kills live lice and partially ovicidal kills some lice eggs. A second treatment is recommended if live lice still are present 7-9 days after treatment. Malathion is intended for use on persons 6 years of age and older. Malathion can be irritating to the skin. Malathion lotion is flammable; do not smoke or use electrical heat sources, including hair dryers, curlers, and curling or flat irons, when applying malathion lotion and while the hair is wet. Spinosad topical suspension, 0. Since it kills live lice as well as unhatched eggs, retreatment is usually not needed. Nit combing is not required. Spinosad topical suspension is approved for the treatment of children 6 months of age and older. It is safe and effective when used as directed. Repeat treatment should be given only if live crawling lice are seen 7 days after the first treatment. For second-line treatment only: None available Lindane is an organochloride. Overuse, misuse, or accidentally swallowing lindane can be toxic to the brain and other parts of the nervous system; its use should be restricted to patients for whom prior treatments have failed or who cannot tolerate other medications that pose less risk. Lindane should not be used to treat premature infants, persons with HIV, a seizure disorder, women who are pregnant or breastfeeding, persons who have very irritated skin or sores where the lindane will be applied, infants, children, the elderly, and persons who weigh less than pounds. Retreatment should be avoided. Back to Top When treating head lice Do not use extra amounts of any lice medication unless instructed to do so by your physician and pharmacist. The drugs used to treat lice are insecticides and can be dangerous if they are misused or overused. All the medications listed above should be kept out of the eyes. If they get onto the eyes, they should be immediately flushed away. Do not treat an infested person more than 2-3 times with the same medication if it does not seem to be working. This may be caused by using the medicine incorrectly or by resistance to the medicine. Always seek the advice of your health care provider if this should happen. Do not use different head

It is possible for head lice to live temporarily on items such as bedding, couches, hair accessories, car seats, toys and clothing. Fortunately, head lice can only survive hour off of the head and are relatively easy to remove from the home. Below are home cleaning instruction which are to be performed after each treatment. Sheets, blankets, and pillow cases, should be put in the dryer for minutes on high heat. Vacuum and cover with sheet or blanket for days. Vacuum floors and discourage others from laying on floors to days Hair Accessories: All clothing worn in last days should be put in dryer for minutes on high, or left unused for days. Vacuum well and visually inspect Toys: A simply, easy way to clean your home is to grab all items that could potentially have lice on them and put them in a garage or closet for 3 days. Washing everything is not necessary. How do get rid of nits from your home? Nits require the warmth and moisture of a human head to hatch. They will not hatch unless they are very close to the scalp. It is not necessary to clean for nits Q: Will a dishwasher kill lice off of a comb? Most dishwashers use extremely hot water which will effectively kill lice. Do I need to steam clean my carpets for lice? A thorough vacuuming is usually enough to remove lice from carpeting. Head lice do not normally end up on carpet unless someone with a moderate to severe lice infestation frequently lies on the carpet. Vacuuming and avoiding laying on carpet for days is a safe alternative to steam cleaning. Do lice live in the mattress or walls? No, lice must drink blood and stay very warm to survive. When lice fall out of the hair they wait for a head and hair to touch them so they can grab on and feed again. They will not crawl into a cold wall or mattress. Can lice live in your bathtub or shower floor? Without hair or fiber to hold onto the lice would simply wash down the drain. For showering, no cleaning is necessary. For bathing, rinse bathtub before use. Do I need to bag my clothes for 2 weeks to kill all of the lice? Head lice can only survive for days off of your head. Some sources recommended to bag items for 2 weeks to a month but this is common misconception and is not necessary. Can lice eggs live in your home? Lice eggs, called nits, can not live anywhere besides a human head. They need to incubate and require warmth and moisture to hatch. Cleaning for lice eggs is not necessary? Do I have to wash all my clothes if I have lice? No, you only need to wash clothes that have been worn in the last days. For moderate to severe infestation you may want wash clothes in closets and drawers that were directly next to a recently worn, possibly infested, item of clothing. Do lice cleaning laundry detergents work? Probably not, even highly toxic pesticides have a difficult time killing lice. A detergent with some basic lice deterrent oils are not going to any more effective. The dryer is the best killer of head lice. The high heat and dry air quickly dehydrate and kill any form of lice. There is no need for lice detergent when the dry cycle of the wash will 1.
