

Chapter 1 : Rie Pie: Spiders, spiders everywhere!

The second appearance of this Brawl was a stand-in for Captain Blackheart's Treasure, the debut of which was prevented by technical difficulties. After a short period during which players were unable to access Tavern Brawls, the latter Brawl was replaced with Spiders, Spiders, EVERYWHERE!

Email Bat-eating spiders are common and apparently creep around every continent, except Antarctica, devouring various bat species. These arachnids ensnare and pounce on bats everywhere else in the world, researchers say. Bats rank among the most successful groups of mammals, with the more than 1, species of bats comprising about one-fifth of all mammal species. Other than owls, hawks and snakes, bats have few natural enemies. Still, invertebrates "creatures without backbones" have been known to dine on bats. For instance, giant centipedes in a cave in Venezuela were seen killing and eating bats, and the arachnids known as whip spiders were spotted feeding on dead bats in caves of the Caribbean. Cockroaches have been observed feeding on bat pups that have fallen to the floor of caves. Spider-eat-bat world Accidental deaths of bats in spiderwebs were known as well, but were thought to happen very rarely. Still, spiders are known to occasionally dine on a variety of vertebrates "creatures with backbones. For instance, fishing spiders capture and devour fish and frogs; some species of wolf spiders, huntsman spiders, tarantulas and related spiders have been seen killing and eating frogs and lizards; and tarantulas and comb-footed spiders have apparently fed on snakes and mice. There are also numerous reports of spiders killing other flying vertebrates, snagging birds with large orb webs. Recent studies of a web-building spider species *Argiope savignyi* and a tarantula species *Poecilotheria rufilata* both killing small bats led researchers to suggest that bat captures and kills due to spiders might be more frequent than previously thought. The search revealed 52 cases of bat-catching spiders worldwide. About 40 percent live in the neotropics "the whole of South America, and the tropical regions of North America" while nearly a third live in Asia and more than a sixth live in Australia and Papua New Guinea. Eighty-eight percent of the reported cases of bat catches were due to web-building spiders, with giant tropical orb-weaving spiders with a leg-span of 4 to 6 inches seen catching bats in huge, strong orb-webs up to 5 feet wide. In instances seen in Costa Rica and Panama, the spiders had built their webs near buildings inhabited by bat colonies. Bat-catching via spiderwebs was also witnessed particularly often in the parks and forests of the greater Hong Kong area. Future research may investigate whether the huge webs that sometimes block the entrances of tropical bat caves in east and southeast Asia and the neotropics may occasionally snag any members of the giant swarms of bats that emerge from the caves at night. For instance, tarantulas were seen eating small bats in tropical rainforests in Peru and eastern Ecuador and on the forest floor in northeastern Brazil. A reddish parachute tarantula *Poecilotheria rufilata* was also seen preying on a small bat in Kerala, India, while a huntsman spider *Heteropoda venatoria* was observed capturing and killing a small bat in a shed near Kolkata, India. An attempt by a large fishing spider *Dolomedes triton* to kill a bat pup was also witnessed below a bridge in Indiana. The victims Most bat prey of spiders are small or juvenile insect-eating bats, and usually are among the most common bat species of their areas. Bats entangled in webs were usually 4 to 9. Bats are likely capable of detecting spiderwebs via echolocation, their biological sonar. Even if bats do collide with spiderwebs, only the strongest traps are likely capable of withstanding the energy of such an impact without breaking. As such, bat captures are likely rare. Still, as scarce as spider captures of bats likely are, they would prove well worth the effort. The catch of a 2-gram bat by the giant orb-weaving spider *Nephila pilipes*, a common killer of bats, would be a bonanza about 10 times the mass of the average daily catch of insect prey, researchers noted. Chapter 2 : Spiders, Spiders, EVERYWHERE! | Hearthstone: Heroes of Warcraft Wiki | FANDOM powered

Spiders, Spiders, EVERYWHERE is This Week's Brawl. Spiders have overrun everything, including your deck! Whatever class you play, your deck will be TEEMING with Webspinners.

Spiders have overrun everything, including your deck! Rewards You receive one Classic Pack for your first victory! Does win count add to reward? This also makes Starving Buzzard very strong with all of the Webspinner s. Then you think about the fact that they also have Sacrificial Pact with no Demonic Beasts to work with. A strong spell for Hunter is Feign Death. Paladin suffers from some poor Secrets, but can also draw a very expensive 5 mana 1 damage spell in Holy Wrath due to all the Webspinners. Although, if you are feeling really lucky you can hope to draw a Lay on Hands off of your Holy Wrath for the big 8 damage! Rogue is poised for aggression with all the 1 drops and an easily comboed Headcrack. Shaman has some interesting spell cards. It has a low cost potential board clear in Lightning Storm , and also has Bloodlust which can take advantage of a flooded board. Far Sight will probably be your dead card because of the spiders. Whirlwind is okay, but obviously it hurts your own minions. Mage is obviously a good class because of its Hero Power. Unstable Portal can even be used to get outside minions that could turn the tides! Imagine getting a well timed Hemet Nesingwary. Priest has some okay spells, but without Auchenai Soulpriest getting minions off the board will be tougher then usual. Thoughtsteal is probably just going to net you two Webspinner, and Mindgames is practically guaranteed to do that unless your opponent has played Malorne!!! Savage Roar could also be put to use if you have a strong board. Moonfire is for sure getting value 0 mana?!? Recycle feels pretty dead, but you could potentially use it on their Savannah Highmane.
