across complex and disparate ERP systems. CollectOne provides debt collection organizations of all sizes flexible, all-in-one, debt collection software designed to cost effectively maximize recoveries. Compass Collections Manager occupies a truly unique corner of the debt collections software arena: No strings attached, no limit on the number of users you can have, and no crippled controls. With the free version, you can enter payments, make calls, keep notes, create and print letters, and generate copious and customizable reports. You also have an advanced user management system at your fingertips. Persolvo Data Systems is the leading aggregator of account information of debtors enrolled in Debt Settlement Programs. CoreCard Software offers a variety of card management software and processing solutions for companies providing credit, debit, prepaid, private label, healthcare, payroll, rewards and fleet cards. Unlimited support for one monthly fee. Debt Collection Software by CollectionWorks: Debt Collection Software for debt collection agency designed by industry specialists. At CollectionWorks Software, we understand debt collection agency needs, and offer an all-in-one solution! Stop writing off Debts. LegalSoft is the leading debt collection software for the South African and other Southern African markets. Evaluate our software free of charge for 60 days. The whole debt collection process including litigation, repossessions, process serving, field investigation and online database searching is covered in a single application that has been proven to be successful and is used daily by more than users. Faster collection means better client service – a huge competitive advantage. Simplicity is something we consider to be of vital importance. We are constantly striving to provide the most intuitive ways to accomplish every task you need to do throughout the debt collection process. We know that many of our users are not computer experts and we want it to be simple for them to get their job done as quickly and effortlessly as possible. Clients include both the high street practice and firms in the UK top In addition to the traditional law firm other clients include legal departments of PLCs, multinationals and government departments. This is a testament to both the scalability and flexibility of the product. Debtpack provides advanced credit management solutions with their experienced consulting team and easy to use debt management software. Debtrak has provided Debt Collection Software Solutions to the receivables management industry since Debtrak have a comprehensive 24 hour support team with developers and account managers based throughout Europe and APAC. Our intuitive, user-friendly interfaces and simple management tools help companies reach accounts and customers while maintaining compliance. Customizable options tailor to suit your needs and scale as your business and its requirements grow. Emagia is a leading provider of Order-to-Cash Management Software helping customers reduce credit risk, improve DSO and maximize cash flow. Accounts receivable collection software increases cash flow, reduces carrying costs, and lowers the cost to collect outstanding debts. Contact us today for more info. R Systems, an IT services and solutions company offers offshore product development services, offshore product development, outsourced product development and BPO services operating from India more than 10 development centers worldwide. Best Auto Debt Collection Software System for debt collection agencies, debt buyers, and legal collection firms. Ansonia Credit Data is the next generation business credit reporting service. No annual fees, no long-term contracts, no setup charges – just affordable quality data. Call centre software reimaged. Secure, advanced, pay as you go technology for dynamic businesses. Cloud contact centre solutions by Magnetic North. We look at the world from a fresh perspective, enable IT-transformation through digitalization and create innovative ecosystems to accelerate your business. Payment Savvy brings focus and dedication to the payment processing industry. We are here to listen and create a solution that will work best for you! PDS Cortex, medical practice management software, is HIPAA-compliant with appointment scheduling, billing, collection, insurance, coding, electronic medical records. Credit counseling software, debt settlement software, debt negotiation and debt consolidation software for debt settlement, credit counseling and debt management agencies. Our software contains the framework for a new generation; from tools and interfaces which further extends the use of technology as a catalyst towards profitability. Chapter 3 : Best Field Service Management Software | Reviews of the Most Popular Systems

As informed and informative as it is practical and user friendly, the Inventor s Complete Handbook is very highly recommended for personal, community, and academic library reference collections. --The Business Shelf - Midwest Book Review.

GPEA requires Federal agencies, by October 21, , to allow individuals or entities that deal with the agencies the option to submit information or transact with the agency electronically, when practicable, and to maintain records electronically, when practicable. The Act specifically states that electronic records and their related electronic signatures are not to be denied legal effect, validity, or enforceability merely because they are in electronic form, and encourages Federal government use of a range of electronic signature alternatives. Inquiries may also be addressed to: GPEA is an important tool to improve customer service and governmental efficiency through the use of information technology. This improvement involves transacting business electronically with Federal agencies and widespread use of the Internet and its World Wide Web. As public awareness of electronic communications and Internet usage increases, demand for on-line interactions with the Federal agencies also increases. Moving to electronic transactions and electronic signatures can reduce transaction costs for the agency and its partner. Transactions are quicker and information access can be more easily tailored to the specific questions that need to be answered. As a result data analysis is easier. In addition, reengineering the work process associated with the transaction around the new electronic format can give rise to other efficiencies. Electronic commerce, electronic mail, and electronic benefits transfer can require the exchange of sensitive information within government, between the government and private industry or individuals, and among governments. A corresponding policy and management structure must support the hardware and software that delivers these services. To provide for a broad framework for ensuring the implementation of electronic systems in a secure manner, the Administration has taken a number of actions. In February , OMB revised Appendix III of Circular A, which provided guidance to agencies on securing information as they increasingly rely on open and interconnected electronic networks to conduct business. In May , the President issued Presidential Decision Directive 63, which set a goal of a reliable, interconnected, and secure information system infrastructure by the year , and significantly increased security for government systems by the year based on reviews by each department and agency. On December 17, , the President issued a Memorandum, "Electronic Government," which called on Federal agencies to use information technology to ensure that governmental services and information are easily accessible to the American people Weekly Compilation of Presidential Documents, vol. Among other things, the President charged the Administrator of General Services, in coordination with agencies, to assist agencies in the development of private, secure and effective electronic communication across agencies and with the public through the use of public key technology. This technology can offer significant benefits in facilitating electronic commerce through a shared, interoperable, government-wide infrastructure. What is the purpose of GPEA? GPEA seeks to "preclude agencies or courts from systematically treating electronic documents and signatures less favorably than their paper counterparts", so that citizens can interact with the Federal government electronically S. It requires Federal agencies, by October 21, , to provide individuals or entities that deal with agencies the option to submit information or transact with the agency electronically, and to maintain records electronically, when practicable. It also addresses the matter of private employers being able to use electronic means to store, and file with Federal agencies, information pertaining to their employees. GPEA states that electronic records and their related electronic signatures are not to be denied legal effect, validity, or enforceability merely because they are in electronic form. It also encourages Federal government use of a range of electronic signature alternatives. It was also sent directly to Federal agencies for comment and made available via the Internet. In addition, OMB met with relevant committees and staff of many interested organizations including: All were uniformly positive about the content and tone of the guidance.

OMB received specific comments from 24 organizations. Most comments proposed changes in clarity and detail. Where the comments added clarity and did not contradict the goals of the guidance, they were incorporated. The principal substantive issues raised in the comments and our responses to them are described below. Comments regarding risks and benefits

A number of comments, including those from the Justice Department and the General Accounting Office, requested that the guidance contain further information on how to conduct the assessments of practicability needed to determine the proper combination of technology and management controls to manage the risk of converting transactions and record keeping to electronic form, and then conducting transactions electronically. Each assessment should contain elements of risk analysis and measurements of other costs and benefits. Most comments on assessment referred to the risk analysis portion. Risk analyses provide decisionmakers with information needed to understand the factors that can degrade or endanger operations and outcomes and to make informed judgments about what actions need to be taken to reduce risk. Consistent with the Computer Security Act 40 U. A, "Security of Federal Automated Information Resources," 34 FR , February 20, , Federal managers should design and implement their information technology systems in a manner that is commensurate with the risk and magnitude of harm from unauthorized use, disclosure, or modification of the information in those systems. To determine what constitutes adequate security, a risk-based assessment must consider all major risk factors, such as the value of the system or application, threats, vulnerabilities, and the effectiveness of current and proposed safeguards. Low-risk information processes may need only minimal consideration, while high-risk processes may need extensive analysis. NIST provides guidance on risk analysis in available at <http://www.nist.gov>: This document is intended to help Federal managers implement an ongoing information security risk analysis process by suggesting practical procedures that have been successfully adopted by organizations known for their good risk analysis practices. This document describes various models and methods for analyzing risk, and identifies factors that are important in a risk analysis. A quantitative risk analysis generally attempts to estimate the monetary cost of risk compared with that of risk reduction techniques based on 1 the likelihood that a damaging event will occur, 2 the costs of potential losses, and 3 the costs of mitigating actions that could be taken. Availability of data affects the extent to which risk analysis results may be quantified reliably. The GAO report recognizes, however, that reliable data on likelihood and risks often may not be available, in which case a qualitative approach can be taken by defining risk in more subjective and general terms such as high, medium, and low. In this regard, qualitative analyses depend more on the expertise, experience, and good judgment of the Federal managers conducting the analysis. It also may be possible to use a combination of quantitative and qualitative methods. Other commenters wanted more guidance on how to weigh the risk analysis with other costs and benefits. In combination with the risk analysis, the results of a cost-benefit analysis should be used to judge the practicability of such a process transformation. When developing collections of information under the Paperwork Reduction Act, agencies currently address the practicality of electronic submission, maintenance, and disclosure. In addition, agencies should follow OMB Memorandum "Incorporating and Funding Security in Information Systems Investments", issued February 28, , which provides information on building security into information technology investments also available at: <http://www.omb.eop.go>. The Department of Justice commented on the need for each agency to consider the broad range of legal risks involved in electronic transactions. The risk analysis process required by the Computer Security Act and by good practice must be tailored to the risks and related mitigation costs that pertain to each system, as understood by the Federal managers most knowledgeable with the systems. When evaluating legal risks, Federal managers should consult with their legal counsel about any specific legal implications due to the use of electronic transactions or documents in the application in question. Agencies should also keep in mind that GPEA specifically states that electronic records and their related electronic signatures are not to be denied legal effect, validity, or enforceability merely because they are in electronic form. We are not, therefore, prescribing specific "one size fits all" requirements applicable to transactions regardless of sensitivity. In light of all the above comments, we have added greater detail to the practicability aspects of the guidance, and an expanded discussion of

cost-benefit analysis and its relation to risk analysis. We have also placed additional emphasis on the need for risk analyses to identify and address the full range of risks, including reasonably expected legal and enforcement risks, and technological risks. Further, we included a reporting mechanism in Part I Section 3 to facilitate the assessment of practicability. Although many of the comments concern the costs and risks of changing to electronic transactions, it is also important to consider the full range of benefits that electronic transactions can provide. Comments regarding technology neutrality A number of comments concerned the emphasis on technology neutrality with regard to the various electronic signature alternatives. They suggested we endorse one electronic signature technology in order to promote interoperability and ease of use. They expressed concern that promoting one technology requires predicting the direction and future of information technology standards and practices, which is a notoriously difficult task. Further, there are sometimes technologies that naturally fit particular electronic transactions and are easier to implement from a security, privacy, technical, or operational perspective than others. For example, implementing a technology that is easy to use would naturally fit when encouraging citizens to participate in electronic transactions. We do not believe it would be appropriate to endorse one technology, and we share the concerns of those commenters who argued against such an endorsement. At the same time, we recognize that cryptographically-based digital signatures i. There are, however, applications where personal identification numbers PINs and other shared secret techniques may well be appropriate. These are generally relatively low risk applications where interoperability is of lesser importance. A number of agencies have successfully used PINs in groundbreaking applications, particularly the Securities and Exchange Commission for regulatory filings and the Internal Revenue Service for tax filings. They have recognized the benefits of using PINs, but at the same time they are planning for an eventual transfer to digital signatures. Accordingly, the final guidance maintains the basic policy of technology neutrality for automated transactions while recognizing that agencies should select an alternative relative to the risk of the application, and calls on agencies to consider all of the available electronic signature technologies including the advantages of public key technology as part of their assessments. Comments regarding records management Several comments suggested that the guidance should give further emphasis to the role of the National Archives and Records Administration in working with the agencies to address the maintenance, preservation, and disposal of Federal records that are associated with electronic government transactions. Comments regarding privacy protection Some commenters were concerned with the privacy implications of the guidance. They want to ensure that any move to electronic transactions does not encourage the gathering of unnecessary information, and that Federal agencies adequately protect the personal information that does need to be collected. We agree that agencies must incorporate privacy protections when developing electronic processes. Several helpful suggestions were made that have been incorporated into the final guidance. United States, F. State, local and non-governmental concerns A number of comments were received from non-Federal entities. These comments were primarily concerned with the broader implications of the Act itself rather than the draft guidance. Specifically, some governmental entities expressed concern that Federal adoption of routine electronic transactions would require state and local governments to provide equivalent access for citizens. Some commenters were also concerned that they would be required to make all future transactions with the Federal government in an electronic format. Consultations with the state government groups identified above, during and subsequent to the comment period, seem to have alleviated these concerns significantly, particularly as we explained that GPEA contemplates optional rather than mandatory electronic transactions with the Federal government. Agencies are required to provide the option to their transaction partners. Transaction partners are not required to use the electronic option. What Are the Future Plans for this Guidance? What policies and procedures should agencies follow? What GPEA policies should agencies follow? What GPEA procedures should agencies follow? How should agencies implement these policies and procedures? How can agencies improve service delivery and reduce burden through the use of electronic signatures and electronic transactions? What is an "electronic signature? How should agencies assess the risks, costs, and benefits? What benefits should agencies consider
