We recommend increasing by about 1gb at a time. If so, Lower or turn off UAC. Try running the installer again. Error or upon installation If you receive an error or upon installation: Check your InDesign version. The plugin is compatible with InDesign CC It is not compatible with CS5 or CS6. Close InDesign Uninstall the plugin and then reinstall. If this happens try minimizing InDesign to your system tray, or clicking back into the active window, and then back again into InDesign. This will force the plugin to restart. Updating resolutions causes InDesign to freeze If the plugin has frozen while updating the image files in the document: Next, check the cache size. Check your OpenAsset to see if the default InDesign drag and drop size is created for that image. You can find this in the file info page - under the Image Sizes tab. When that happens the image displayed will only be the thumbnail size. You should now be able to pull the image into your InDesign document. If the image size has been created, check your cache size as the InDesign plugin may be running out of space to store the images. See link to section above - changing cache size above for instructions on how to change your cache size. Re-sizing issues This is most likely related to the version of the plugin you are using. Please navigate to the top of this page to update to the latest version link to above where it explains how to check and update version - first thing on the page. In this tutorial we will see: How to import a Word document into InDesign [Pro Tip] Use master pages to automatically flow a Word document update Import Word files in InDesign When having to deal with a coworker or client who needs or wants to edit the text inside your InDesign document, the best solution is to prepare your InDesign file beforehand. Linking Word documents to an InDesign file is great because it allows you to work on your layout inside InDesign and your coworker, client, or whoever has to type the content to work in a software much simpler and cheaper, like Microsoft Word. Setting up the source file When you import a Word document into an InDesign file, the default settings are to also import the styles applied to the text in Word. You can leverage this feature to override the appearance of the imported text we will see later how to do so and make the import in InDesign and layout of the text very quickly. The conversion instead applies the bulleted text characteristics as an inline property. I have a simple one page document in Word that I want to import into my document in InDesign. Like in InDesign, pay attention to not set inline properties to the text inside Word. This is very important if you want to have control over your document and lay out the text quickly. Also, the two strings clearly have different styles. Instead, the screenshot to the right shows the text with the right Paragraph Style that I created. Want to get better at InDesign? As mentioned above, be sure that the styles in the Word document are correctly set to the text. In this window, you can personalize a few settings. Generally, the default settings are OK. However, you should pay special attention to these settings: This will import the text and emulate the Styles of the Word file in InDesign. Lately, we will then change those styles created by the import and see what happens when we import the same document again. See, the text in InDesign right has the same styles and appearance of the text in Word left. We are going to override the settings of the Paragraph Styles. As you see, near the imported Paragraph Styles there is an icon that shows that the Style has been imported, and none of the properties is overridden. Source Sans Pro, bold, 12 pt, color: Source Sans Pro, regular, 12 pt, color: InDesign tells us that there are Style Name Conflicts. Use InDesign Styles Definitions: This overrides the styles of the text imported from the Word file to the InDesign document. This imports the text with the styles in Word and creates new styles in your InDesign document. See, InDesign automatically set the new characteristics to the text you imported from the Word document. If you already created the Paragraph Styles with the same names of the Styles in Word, InDesign will override the settings of the text imported from Word. Please notice that now, in the Link menu, the link to the Word file has appeared. In the Link menu, next to the name of the Word file, InDesign shows a warning triangle that indicates that the linked file has been modified. If we double click on the triangle, InDesign will ask to update the content. Here is the result of the update. Remove link with an imported Word document In case you want to remove the link to the file Word in InDesign, double click above the link to the file and then select Unlink. Instead, inline style applied to the tables in Word are kept. The best way to deal with an external table, however, is by using a spreadsheet in Excel see how here. A few caveats Footnotes: If you place images inside a Word document, InDesign will import them as embedded images. Linking images is always the best solution because it keeps the file size down and makes work more efficient allowing you to update the image. Who needs to import shapes from a Word document to an InDesign file? InDesign can load an entire story from a Word document automatically, creating pages and threading text-frames. How do you do that? Check out this blog post to see

how to use InDesign Master Pages to flow your Word document automatically. WordsFlow maintains a dynamic link so it can intelligently merge external document changes into the InDesign story contents on each link update, rather than just replacing the story. Import the Word file using automatic semantic structuring I found another extension that is worth checking out if you want to import your text from the Word file in a clean and semantically structured way to then apply your styles in InDesign. The plugin uses the Bookalope web services, which work with an AI to strip away all visual styles and cleans up the document automatically, and then exports a semantically structured document to InDesign. The InDesign document will of course have all styles that you can quickly edit and layout the document. Even better, all styles are already mapped to HTML tags for your ebook export as well.
