

Windows 98 Annoyances is, ultimately, about hacking Windows 98, never accepting anything as good enough, and always looking for a better way to do things. Karp provides excellent guidance to the Windows 98 power user.

TXT, part of WD. The Windows 98 memory manager architecture divides memory into 2 parts: A process in memory will demand a particular section of code; if that section of code is in VCACHE, it can be accessed and used much more quickly than if that section of code needs to be read from a file on disk. Memory allocated to the disk cache is not available to executing processes. Reducing the amount of memory available to running applications negatively impacts performance by increasing the amount of data swapped from memory to the hard disk. The disadvantage is only obvious on PCs with less than 64 MB of RAM that this "retained" memory is not available to applications anymore, thus reducing the amount of memory Windows 98 can "play" with. Therefore it is recommended to enable the Win98 "mapped cache" feature on machines with at least 64 MB RAM and definitively if you have MB or more , to improve performance at the expense of little less memory available to programs. To do so, start Regedit and go to: If you see it, delete it: Close the Registry Editor and restart Windows. Create a new "MapCache" entry: Exit the Registry Editor and restart Windows. Open it in Notepad for reading. These are 2 information. To do this right-click on the one you want in Explorer, select Install, and finally restart Windows. TXT part of WD. The standard ATX 2.
